Overview

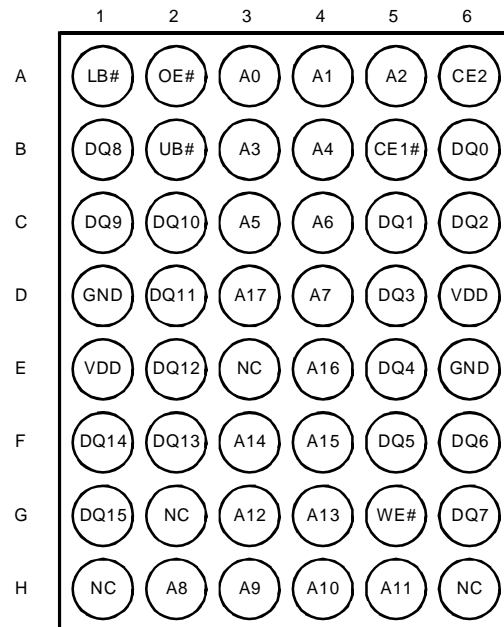

The EM584161 is a 4,194,304-bit SRAM organized as 262,144 words by 16 bits. It is designed with advanced CMOS technology. This Device operates from a single 1.65V to 1.95V power supply. Advanced circuit technology provides both high speed and low power. It is automatically placed in low-power mode when chip enable (CE1#) is asserted high or (CE2) is asserted low. There are three control inputs. CE1# and CE2 are used to select the device and for data retention control, and output enable (OE#) provides fast memory access. Data byte control pin (LB#,UB#) provides lower and upper byte access. This device is well suited to various microprocessor system applications where high speed, low power and battery backup are required. And, with a guaranteed operating range from -40°C to 85°C, the EM584161 can be used in environments exhibiting extreme temperature conditions.

AC Test Condition

- Input pulse level : 0.2V, V_{DD}-0.2V
- Timing measurements : 0.5 x V_{DD}
- t_R, t_F : 5ns

Read Cycle (See Note 1)

Write Cycle 2 (CE1# Controlled)(See Note 4)

Write Cycle 3 (CE2 Controlled)(See Note 4)

Write Cycle4 (UB#, LB# Controlled)(See Note 4)

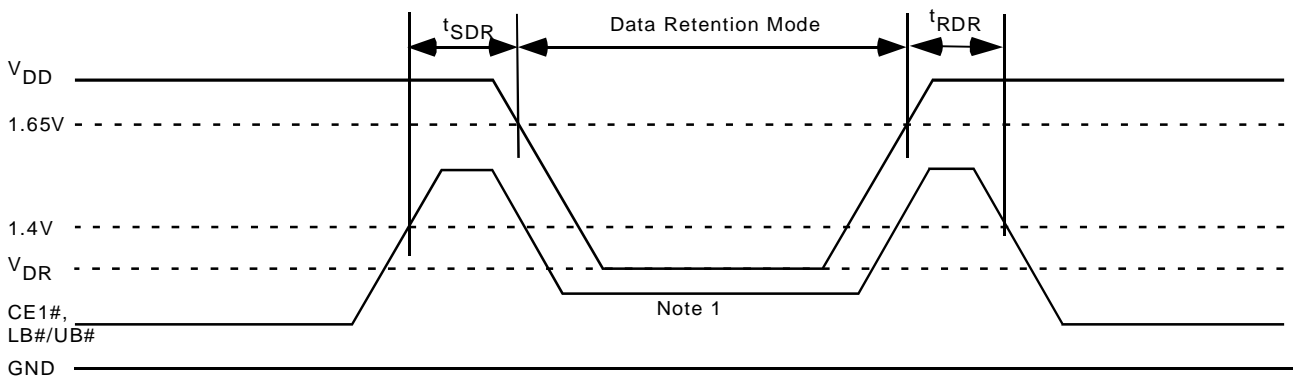

Note:

1. WE# remains HIGH for the read cycle.
2. If CE1# goes LOW (or CE2 goes HIGH) with or after WE# goes LOW, the outputs will remain at high impedance.
3. If CE1# goes HIGH (or CE2 goes LOW) coincident with or before WE# goes HIGH, the outputs will remain at high impedance.
4. If OE# is HIGH during the write cycle, the outputs will remain at high impedance.
5. Because I/O signals may be in the output state at this time, input signals of reverse polarity must not be applied.
