## 6. Functional Description

### 6.1 General Description

Dedicate GPIO functions. That includes two sets of watchdog timer. One Set of Watchdog timer timeout unit is set to second and range is 0 to 127 seconds. The other Watchdog timer is set to second or minute and the range is 0 to 256 seconds or minutes. When the timeout has occurred, that will generate a status bit to indicate it and write one will be clear. All GPIO can be programmed to logic one or zero or high pulse or low pulse.

### 6.2 Access Interface

The F75111 provides one serial access interface, I2C Bus, to read/write internal registers. The address of Serial Bus is configurable by using power-on trapping of standby power VBS3V. The pin 3 (GPIO13/I2C \_ADDR) is multi-function pin. During the VSB3V power-on, this pin serves as input detection of logic high or logic low. This pin is default pull-down resistor with 100K ohms mapping the Serial Bus address 0x9C (1001\_1100). Another Serial Bus address 0x6E (0110\_1110) is set when external pull-up resistor with 10K ohms is connected in this pin.

### 6.3 The SMBus access timing are shown as follow:

**(a) SMBus write to internal address register followed by the data byte**

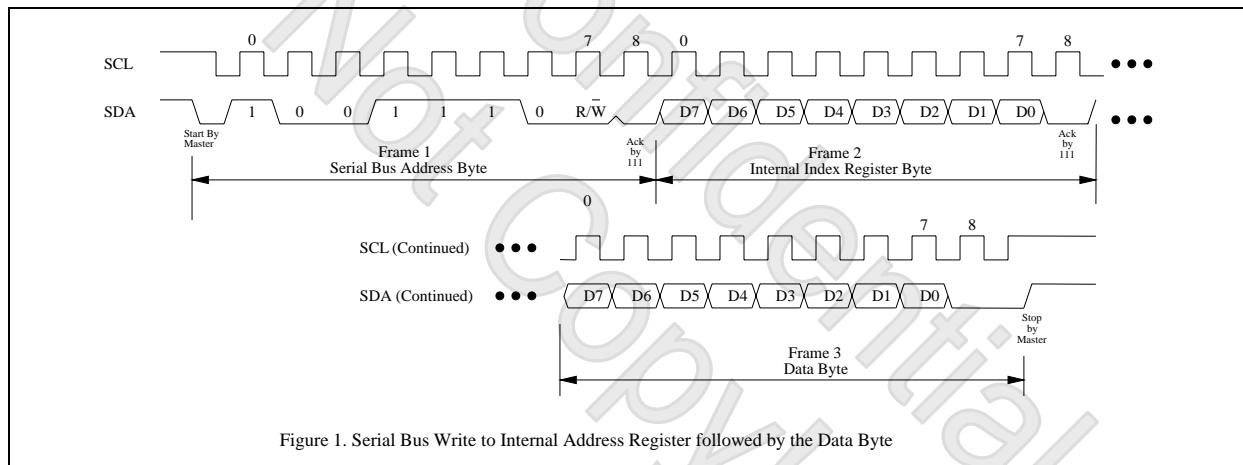

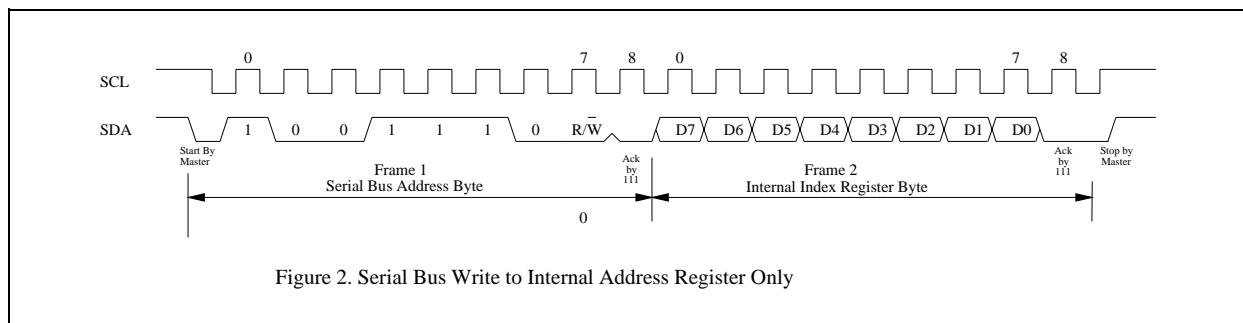

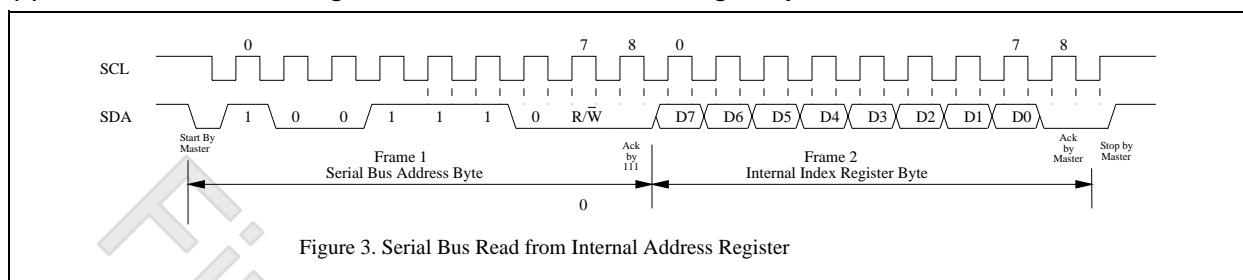

Figure 1. Serial Bus Write to Internal Address Register followed by the Data Byte

**(b) Serial bus write to internal address register only**

**(c) Serial bus read from a register with the internal address register prefer to desired location**
