2. MIL-HDBK-217F Notice2 @Ta=25 °C, Full load(Ground, Benign, controlled environment).
3. External with $C_{out} = 1\mu F$ ceramic//10μF tantalum capacitors.
4. Output voltage programmable from 0.75V to 3.3V by connecting a single resistor (shown as Rtrim in Table 1) between the TRIM and GND pins of the module. To calculate the value of the resistor R_{trim} for a particular output voltage V_o , use the following equation:

$$R_{trim} = \left[\frac{21070}{V_o - 0.7525} - 5110 \right] \Omega$$

5. It's necessary to equip the external input capacitors at the input of the module. The capacitors should connect as close as possible to the input terminals that ensuring module stability. The external C_{in} is $2 \times 150\mu F$ low-ESR polymer capacitors // $2 \times 47\mu F$ ceramic capacitors at least.
6. Device code with suffix "-P" – Positive logic(On/Off is open collector/drain logic input; Signal referenced to GND)
- Device code with no suffix – Negative logic (On/Off pin is open collector/drain logic input with external pull –up resistor; signal referenced to GND)
7. Case 1 :On/Off input is set to logic low (module on) and then input power is applied (delay from instant at which $V_{in}=V_{in}(\min)$ until $V_o=10\%$ of $V_o(\text{set})$)
8. Case 2 :Input power is applied for at least one second and then the On/Off input is set to logic low (delay from instant at which $V_{on/off}=0.3V$ until $V_o=10\%$ of $V_o(\text{set})$)

CAUTION: This power module is not internally fused. An input line fuse must always be used.
