FAN8729

Spindle+4-CH Motor Drive IC

Features

- Built-in Power Save Circuit
- Built-in Current Limit Circuit
- Built-in Thermal Shutdown Circuit (TSD)
- Built-in TSD Monitor Circuit
- Built-in FG Signal Output Circuit
- Built-in Rotational Direction Detecting Circuit
- Built-in Protection Circuit For Reverse Rotation
- Built-in 4-CH Balanced Transformerless (BTL) Driver
- Built-in BTL MUTE Circuit (CH123 and CH4)
- Corresponds to 3.3V DSP

Description

The FAN8729 is a monolithic integrated circuit built-in 4Channel BTL motor and spindle motor drivers, which can drive tracking actuator, focus actuator, sled motor, loading motor, 3-phase BLDC motor, and it is applicable to DVD-P/MDP/CAR-MD/CAR-NAVIGATION systems.

48-QFPH-1414

Typical Application

- Mini Disk Player
- Digital Video Disk Player
- Car Mini Disk Player
- Car navigation System

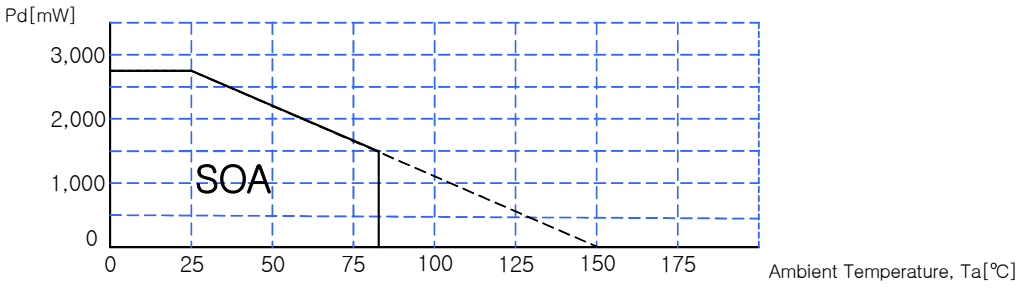
Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Value	Unit
Supply Voltage (Spindle Signal)	SV_{CC1max}	7	V
Supply Voltage (BTL Signal)	SV_{CC2max}	15	V
Supply Voltage (Spindle Motor)	V_{M1max}	15	V
Supply Voltage (BTL Motor)	$V_{M2,3,4max}$	15	V
Power Dissipation	Pd	2.7[note]	W
Operating Temperature Range	Topr	-35 ~ +85	°C
Storge Temperature Range	Tstg	-55 ~ +150	°C
Maximum Output Current (Spindle Part)	I_{OMAXS}	1.3	A
Maximum Output Current (BTL Part)	I_{OMAXB}	1	A

Note:

1. When mounted on the PCB (phenolic resin material) of which size is 114mm × 76mm x1.6mm.
2. Power dissipation is reduced with the rate of -21.6mW/°C for TA≥25°C.
3. Do not exceed Pd and SOA.



Recommended Operating Conditions (Ta=25°C)

Parameter	Symbol	Min.	Type.	Max.	Unit
Operating Supply Voltage (Spindle Signal)	SV_{CC1}	4.5	-	5.5	V
Operating Supply Voltage (BTL Signal)	SV_{CC2}	4.5	-	13.2	V
Operating Supply Voltage (Spindle Motor)	V_{M1}	4.5	-	13.2	V
Operating Supply Voltage (BTL Motor)	$V_{M2,3,4}$	4.5	-	SV_{CC2}	V

Electrical Characteristics

(Unless otherwise specified, Ta=25°C, SV_{CC1}=5V, V_{M1}=8V, BTL driver part: SV_{CC2}=9V, V_{M2}=5V, R_{L1}=8Ω, V_{M3}=8V, V_{M4}=9V, R_{L2}=15Ω)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Circuit Current 2	I_{CC2}	Start/Stop =5V	-	4.5	-	mA
START/STOP						
SS On Voltage Range	V_{SSON}	L-H Circuit On	2.5	-	-	V
SS Off Voltage Range	V_{SSOFF}	H-L Circuit Off	-	-	1.0	V
HALL AMP						
Hall Bias Current	I_{HA}	-	-	1	5	uA
Common Mode Voltage Range	V_{HAR}	-	1.5	-	4.0	V
Minimum In Level	V_{INH}	-	60	-	-	mVpp
TORQUE CONTROL						
EC Input Voltage Range	E_C		0.5	-	3.3	V
Offset Voltage (-)	E_{COFF-}	E_{CR}=1.65V	-100	-50	-20	mV

Ripple Rejection Ratio4*note	RR4	f= 120Hz, V_{IN}= -20dB	-	60	-	dB
Slew Rate 4*note	SR4	f= 120Hz, 2Vp-p	-	1.0	-	V/us
OP- AMP						
Input Offset Voltage	V_{OF}	-	-20	-	+20	mV
Input Bias Current	I_{B1}	-	-	-	300	nA
High Level Output Voltage	V_{OHOP}	-	8	-	-	V
Low Level Output Voltage	V_{OLOP}	-	-	-	0.1	V
Output Sink Current	I_{SINK}	-	-	5.5	-	mA
Output Source Current	I_{SOURCE}	-	-	4.5	-	mA
Open Loop Voltage Gain*note	G_{VOOP}	f= 1kHz, V_{IN}= -75dB	-	75	-	dB
Ripple Rejection Ratio*note	RR_{OP}	f= 120Hz, V_{IN}= -20dB	-	65	-	dB
Slew Rate*note	SR_{OP}	f= 120Hz, 2Vp-p	-	1	-	V/us
Common Mode Rejection Ratio*note	$CMRR_{OP}$	f= 1kHz, V_{IN}= -20dB	-	80	-	dB

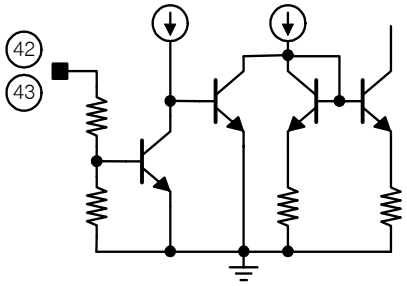
Note: Guaranteed field.(No EDS/Final test)

Application Information

1. MUTE Function

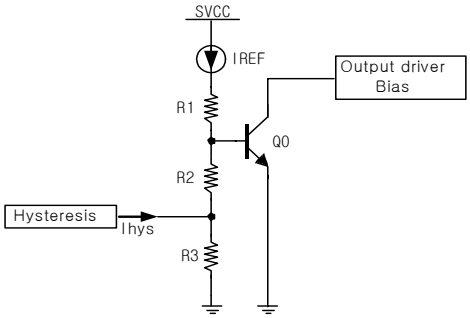
- MUTE circuit turns BTL output ON/OFF.
- When MUTE terminal (pin42, pin43) is OPEN, or terminal voltage is lower than 1V, BTL is disable.
- When MUTE terminal (pin42, pin43) is voltage is higher than 1.5V, BTL output operates normally.
- Feature Table.

MUTE circuit voltage	MUTE status
Above 1.5V	OFF
Below 1V or Open	ON



2. TSD Function

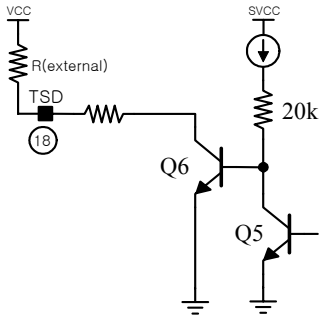
- TSD circuit intercepts all IC output to protect the IC against high temperatures.
- When chip temperature rises above 165°C, BTL and spindle output is disable.
- When chip temperature falls below 140°C, BTL and spindle output operates normally.
- TSD has hysteresis of 25°C.



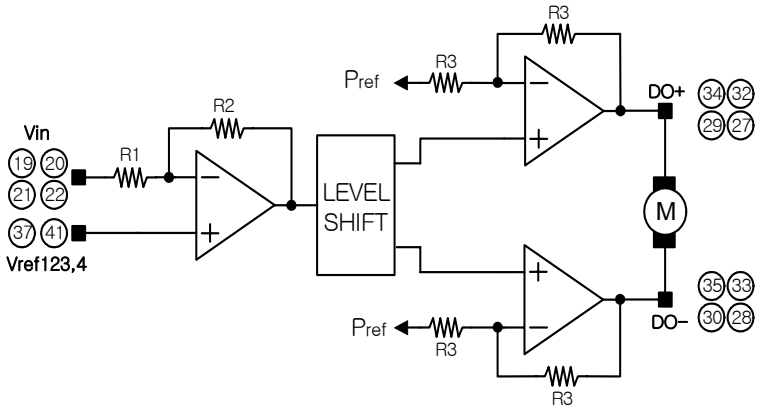
3. TSD Monitor Function

- TSD monitor circuit displays TSD status.
- When TSD is ON, pin18 is HIGH.
- When TSD is OFF, pin18 is LOW.
- Since output pin(PIN18) is open-collector, pull-up resistance should be attached outside.
- Feature Table.

TSD	Pin18
TSD On	High
TSD Off	Low



4. CH1,2,3,4 Balanced Transformerless (BTL) Drive



- Diagram above shows each input/output BTL channel structure.
- When BTL input voltage is Vref, the output voltage is Pref. Pref has the value of VM/2.
- BTL Channel's output voltage is found as follows;

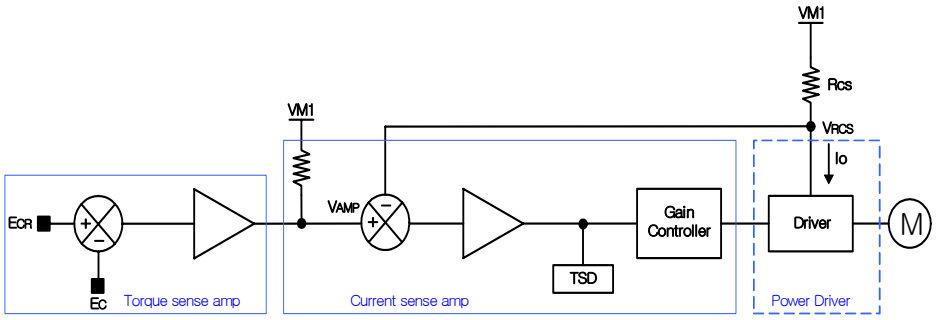
$$Do+ = \Pr ef + \frac{R2}{R1} \times (1 + \frac{R3}{R3}) \times (Vin - Vref)$$

$$Do- = \Pr ef - \frac{R2}{R1} \times (1 + \frac{R3}{R3}) \times (Vin - Vref)$$

- BTL gain value is found as follows;

$$Gain = 4 \times \frac{R2}{R1}$$

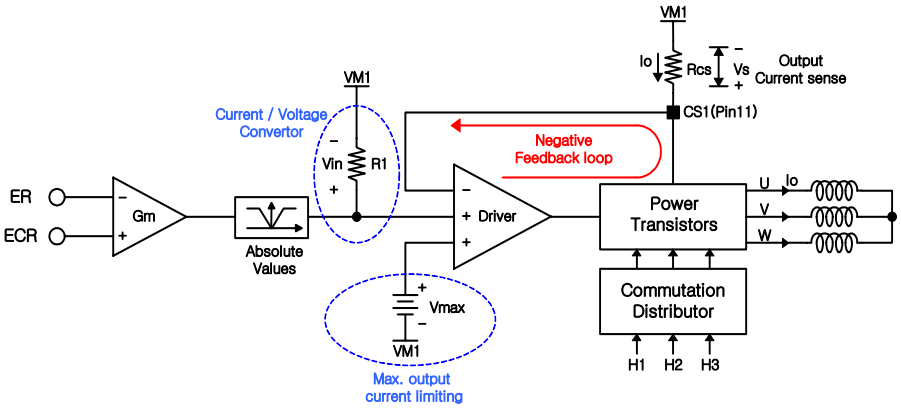
5. Spindle



- The spindle driver circuit consists of 3 section: Torque sense amp, Current sense amp, and Power driver.
- Torque sense amp compares and amplifies EC and ECR signals from SERVO, and sends them to current sense amp. With voltage comparison, it determines the signal as forward or reverse.
- Current sense amp limits the current in Motor(Io) by comparing output current signal from torque sense amp with the current of RCS.
- Power driver output the current to the motor based on the current generated form current sense amp.
- Feature Table

	Rotation
EC < ECR	Forward rotation
EC > ECR	Stop after detecting reverse rotation

6. Calculation of Gain & Torque Current



- Toque limit circuit limits the current of spindle motor.
- Driver amp circuit limits the current of spindle motor by comparing the voltage detected from RCS and the voltage output from torque sense map.
- Output current of the motor can be limited by adjusting the RCS value.
- Maximum output current of motor is found as follows;

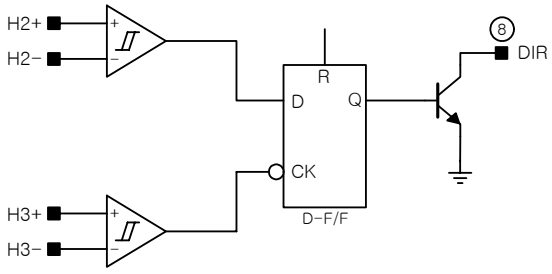
$$Io[mA] = \frac{V\,\max}{Rcs} = \frac{350mV}{Rcs}$$

- VMAX within IC is fixed at 350mV.
- Gm of torque sense amp is set to 0.71.

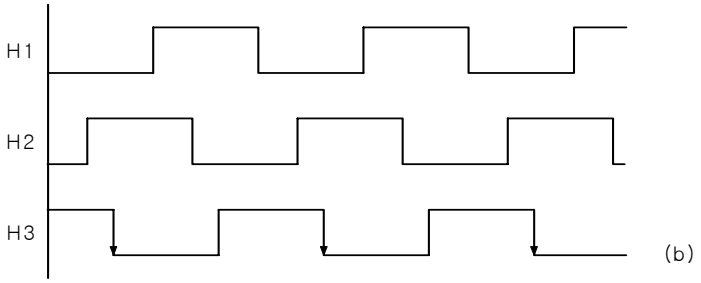
7. Rotational Direction Detecting Function

- Rotation detection circuit gives the result to DIR pin by detecting the MD's rotational direction.
- Detects the MD's rotational direction using hall signals H2 and H3.
- Feature Table.

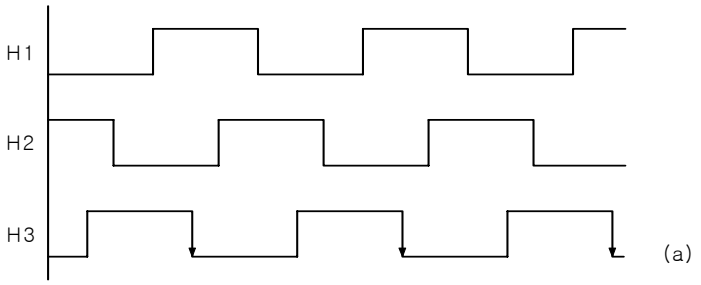
	Rotation	DIR
EC < ECR	Forward	Low
EC > ECR	Reverse	High



- In case of forward rotational detection, the phase of hall signal shows as H3→ H2→ H1 as follows;

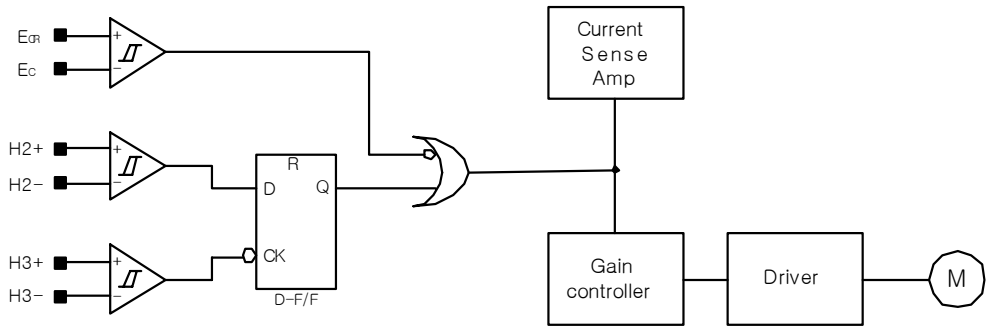


- In case of reverse rotational detection, the phase of hall signal shows as H1→ H2→ H3 as follows;



- Forward/Reverse rotational direction is decided as follows. When hall signal H3 is falling edge, if H2 shows "High", the rotational direction is "Forward", and if H2 shows "Low", rotational direction is "Reverse".

8 Reverse Rotation Preventing Function

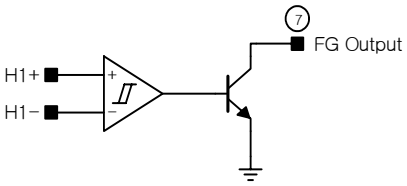


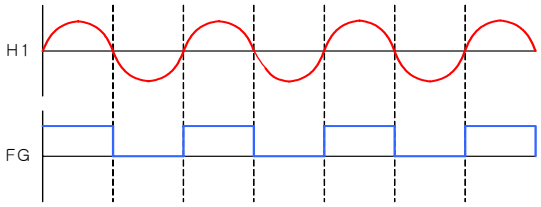
- Reverse rotation prevention circuit has a function for intercepting the reverse rotation of MD.
- When SERVO control input is EC<ECR, MD rotates forward and Q which is the output of D-F/F goes "High".
- When SERVO control input is EC>ECR, motor puts on reverse brake and MD speed is rapidly reduced.
- When SERVO control input remains EC>ECR, MD rotates reverse and Q which is the output of D-F/F goes "Low", in result current sense amp is interrupted. Accordingly gain controller goes OFF and motor is stopped.
- Feature Table.

Rotation	H2	H3	D-F/F	DIR	Reverse Rotation Preventer	
					$E_C<E_{CR}$	$E_C>E_{CR}$
Forward	H	H → L	H	L	Forward	Brake and Stop
Reverse	L	H → L	L	H	–	Stop

8. FG Output Function

- FG circuit outputs the number of motor rotation.
- One pulse per rotation is output of FG.
- FG uses hall signal H1 as its input, and creates output using hysteresis comparator.
- Input/Output wavelength is shown below;





9. Hall Input Output Timing Chart

- Output voltage and current wavelength of each of the 3-phase hall input is shown below.
- The following diagram is the motor's output wavelength in the forward rotation direction.
