

Logic: Standard, Special and Programmable

In Brief . . .

This selector guide is a quick reference to Motorola's vast offering of standard logic integrated circuits. In TTL, popular due to its ease of use, low cost, medium-to-high speed operation and good output drive capability, Motorola offers both LS and FAST. Motorola's CMOS portfolio includes MC14000B standard CMOS series devices, High-Speed CMOS consisting of a full line of products that are pinout-compatible with many LSTTL and MC14000B standard CMOS logic devices which offers designers a solution to the long-standing combined barrier — high speed and low power. Motorola's Emitter Coupled Logic (MECL) is a non-saturated form of digital logic which eliminates transistor storage time permitting very high speed operation. Motorola offers five versions of MECL: MECL 10K, MECL 10H, MECL III, and the recently introduced families ECLinPS (ECL in picoseconds) and ECLinPS Lite. Also included are timing solution products such as clock drivers, clock generators and programmable delay chips, high performance and communications products such as VCO's, prescalers, and synthesizers, and a wide variety of translators, low-voltage bus interface and serial data transmission devices. Field programmable logic and in particular, field programmable arrays, have become the solution of choice for logic design implementation in applications where time to market is a critical product development factor. In addition, reconfigurable arrays have been used to enhance Customer product flexibility in ways that no other technology can match.

INTRODUCTION TO MOTOROLA PROGRAMMABLE ARRAYS AND THE MPA DESIGN SYSTEM

Field programmable logic and in particular, field programmable arrays, have become the solution of choice for logic design implementation in applications where time to market is a critical product development factor. In addition, reconfigurable arrays have been used to enhance Customer product flexibility in ways that no other technology can match.

Programmable logic not only vastly reduces the time necessary to implement a static design, but significant product feature benefits can be realized when hardware can be dynamically altered as easily as software.

The reconfigurable Motorola Programmable Array (MPA) and MPA design system maximize application flexibility and minimize time to market by delivering a gate level, push button, programmable logic solution.

Design Capture

Logic system designers have two basic options when selecting a method for capturing their designs. For smaller or very regular designs, schematic capture continues to be a popular design entry vehicle. With the increasing size and complexity of today's designs coupled with decreasing design cycle time requirements, many designers are turning to Hardware Description Languages (HDLs).

The MPA family was designed from the outset to be well suited to both methodologies. The output of logic synthesis compilers maps effortlessly and efficiently onto the MPA architecture. Unlike other FPGA offerings, the MPA poses no significant architectural limitations for which the designer might otherwise have to adjust his schematic design techniques for.

Push Button Design Implementation

The MPA design system minimizes training investment and automatically generates design implementations which meet timing constraints.

The gate level logic and abundant hierarchical routing resources of the MPA device present a rich implementation media for design implementation. MPA design tools understand and optimally utilize the MPA device resources so there are no elaborate rules to learn or design modifications required to begin design capture. Staying focused on end product design rather than implementation tools or device architecture gets the design done faster and, unlike other programmable solutions, without programmable logic device specificity to impede future design migration efforts. The combination of automatic tools and gate level

architecture is ideal for traditional schematic driven or high level language based design capture methods. In fact, logic synthesis tools were originally designed for and produce the most efficient results for targeting gate level devices.

A design is analyzed, optimized, transformed into MPA cells, partitioned, placed and routed based on timing constraints for all paths in the design – automatically. A netlist from one of the popular design capture systems or an existing XNF or LPM netlist is imported into the MPA design system. The logic is mapped to a series of MPA cells and the entire resulting netlist is optimized and checked. Based on a simple clock specification, the MPA design system generates timing constraints for all paths in the design. During automatic partitioning, placement and routing path slack time is constantly redistributed insuring only the resources required to meet timing requirements are consumed. Because MPA tools implement the design according to constraints, tool induced design iterations are virtually eliminated. Completed layouts can be transformed into device configurations, as well as annotated simulation netlists. A layout browser is also available.

The MPA design system also includes complete on-line, hypermedia, help covers the device, the design system and the integration kits. Integration kits for Viewlogic, Exemplar, VHDL (1076 and SDF), Verilog (OVI and SDF) and OrCAD are included (contact your vendor for additional kits). All these features add up to a powerful yet extremely easy to use design implementation engine for the MPA product family.

Design Importation

Designs can be captured using schematics, a high level language, or a combination of these entry methods using commercially available design capture and logic synthesis software and the appropriate interface kit. Alternatively, existing designs can be retargeted from other programmable logic devices to the MPA device using commercial logic synthesis tools or the powerful retargeting capabilities provided with MPA design system.

Design importation begins with a netlist and an optional clock specification file. The clock specification file provides a mechanism for the user or design capture tools to document system level timing requirements. In addition, a rich set of attributes can be attached to specific components or nets within the design to specify timing and design pinout constraints.

A retargeting rules file is read and the input netlist is transformed into a series of MPA cells and associated interconnections. Rules files provide a mechanism to perform attribute mapping, cell mapping and macro expansion. By creating custom rule files, the user can extend the importation process from arbitrary sources. The MPA design system comes with rules for its native library/EDIF. The resulting netlist is optimized to clip unused logic and remove redundant logic. For example: each MPA cell has programmable input inversion capability. All inverters or non-inverting buffers can be removed from the netlist and replaced with signal sense information attached to each input.

A series of design rule checks are performed to insure design integrity before the layout process begins.

Constraint Generation

Timing constraints, the optimized MPA netlist and static timing analysis is used to generate path slack constraints for all paths in the design. Each unique signal pathway between a register output and a register input throughout the design are enumerated. The total logic and estimated or real wire delays along the path are summed. The time between the active upstream register clock edge and the next active downstream clock edge minus the downstream register setup time is subtracted from the total path delay. This difference is called path slack. If any path in the design has a negative slack value, the implementation will not function at the required clock rate(s).

Path constraints are utilized throughout the layout process to insure that a design implementation which meets timing constraints is automatically generated. If no clock or timing specifications are provided, the MPA design system uses the fastest possible clock based on very small net delay estimates to generate the path constraints. This usually results in the best possible implementation, but may take longer than the time required to generate a satisfactory rather than best possible result.

Contrast this to other programmable logic design tools which only provide manual net constraint annotation or net criticality assignment. In these cases significant effort is necessary to generate constraints and many costly iterations are required to tune these constraints for a given design. If any changes are made to the design, another costly round of iterations is required.

Autolayout

The autolayout process makes use of the hierarchical organization of the MPA device to minimize run time and deliver implementations that meet timing requirements. Designs which have diverse timing requirements are ideally implemented because path slack estimates are refined throughout the autolayout process insuring only the resources required to meet timing requirements are consumed.

The process begins by flattening the design and partitioning it into small component groups of approximately

the same size called clusters. A cluster boundary delay estimation is applied to pull the most tightly constrained paths into a minimum number of clusters. The clusters are then assigned to zones taking into account zonal boundary delay cost and relative zone placement delay costs. Other costs like total number of port connections per zone and are also considered. As assignment proceeds, cluster and zone boundary delay costs are added to each path and slack is recomputed.

Next global placement and routing is done. Global routes begin and end on either I/O cells or port cells. Intrazone placement and routing is deferred to a later phase. During global routing all the port cell and I/O cell locations are fixed and the connections between them established. High fanout nets are constructed in a highly regular manner to insure efficient resource utilization. As in partitioning, slack estimates are refined throughout global routing.

Finally the intrazonal placement and routing is done. Cells assigned to a particular zone are placed and routed to other zone cells or zone port cells. Port cells and core cells are constructed to allow port swapping. Core cells can be routed through if necessary. Allowing core cells to act as routing cells allows dynamic adjustment of routing resources within the zone. Dynamic resource adjustment is a powerful design specific adaptation mechanism.

This process produces a layout from which device configurations, delay back annotations, and chipviews can be generated.

Incremental Design Support

When specification changes necessitate design iterations, simply push the button again. Constraints are automatically recalculated and autolayout only reworks those portions of the design which have changed. Full incremental design support means simple design changes to facilitate design verification can be made quickly and easily.

Delay Back Annotation

Designs can be verified through numerous methods. One particularly useful method is the annotation of device and implementation specific delays back into the original simulation environment to improve system or device level simulation accuracy. A MPA device layout can be transformed into an appropriately formatted delay annotation file or annotated netlist quickly and easily. The annotated delay information represents the worst case delays for a given device speed grade.

Chipview

While the MPA design system provides a rich set of reports describing the implementation of a design, a graphical view of the implementation can be indispensable for reviewing overall layout quality. Chipview provides a graphical view of a completed layout. Chipview can be useful during initial design iterations to visually verify I/O pin placements before commencing PCB layout, for example.

Configuration

A layout can be transformed into a device configuration which, when loaded into the appropriate MPA device, produces a physical design realization. Many formatting options are available. The MPA download pod can be used to emulate a serial PROM. Using the pod, device configuration files can be downloaded to a device directly from the PC or workstation development environment.

Integration Kits

The MPA design system can be used with a large number of commercial electronic design automation software. For each supported vendor, an integration kit is provided which facilitates MPA design within that vendors' environment. Many of these kits are available from Motorola and included

at no charge on the MPA design system CDROM. Other kits can be acquired directly from the vendor. Refer to the MPA Design System Product List for more information.

Low Cost, Easy Access

MPA Design systems are easy to use, competitively priced and widely available. Copies of MPA design system software supporting up to 8000 gates can be downloaded from the World Wide Web (WWW) at URL:

<http://sps.motorola.com/fpga>

Complete kits including download pod, evaluation board, MPA device, CDROM and documentation can be ordered from your local authorized Motorola distributor or Motorola sales representative.

Motorola Programmable Array Design System

DESIGN SYSTEM

The Motorola Programmable Array (MPA) design system is a bridge between a design capture environment and Motorola field programmable arrays. The MPA design system automatically transforms designs into device configurations to realize a design, when loaded into an MPA device. A design is automatically analyzed, optimized, transformed into MPA cells, partitioned, placed and routed based on timing constraints for every path in the design. MPA design tools understand and optimally utilize the MPA device architecture; this eliminates the need to learn a new set of rules and makes these tools ideally suited for use with logic synthesis. Full incremental design support reduces design implementation time and powerful library retargeting capabilities allow you to reuse designs which may have been implemented on less capable devices. The MPA design system operates on existing hardware platforms and supports design capture and simulation tools from more than 10 vendors. All these features plus on-line, hypermedia, help make the MPA design system a powerful, yet extremely easy to use, design implementation engine.

Features

- Push Button Implementation
- Optimal Use of MPA Device Resources
- Optimal Results with Gate Level Design Input
- Library of Common MSI Functions
- Design Flow Manager
- Design Retargeter
- Timing Driven with Integrated Static Timing Analysis
- Layout Delay extraction for post layout simulation
- Layout viewer
- Incremental design support
- On-line, hypermedia, documentation
- Supports all popular design capture and simulation tools
- Lowest cost FPGA development systems.
- Instant access; Downloading via the internet (WWW, ftp).
- Supports multiple speed grades

MPA1000 Programmable Arrays

Motorola Programmable Array (MPA) products are a high density, high performance, low cost, solution for your reconfigurable logic needs. When used with our automatic high performance design tools, MPA delivers custom logic solutions in minutes rather than weeks. And the low cost keeps those solutions competitive throughout the product lifecycle.

The MPA architecture has solved the historical problems associated with fine grain devices without sacrificing re-programmability, reliability, or cost. MPA1000 devices are reprogrammable SRAM based products manufactured on a standard 0.43 μ Leff CMOS process with logic capacities from 3,500 to more than 22,000 equivalent FPGA gates. MPA Logic resources hold a single gate or storage element providing a highly efficient, adaptable, design implementation medium. Gate level logic resources, abundant hierarchical interconnection resources and automatic, timing driven, tools work together to quickly provide design implementations that meet timing constraints without sacrificing device utilization.

Staying focused on end product design rather than implementation tools or device architecture gets the design done faster and, unlike other programmable solutions, without programmable logic device specificity to impede future design migration efforts. The combination of automatic tools and gate level architecture is ideal for traditional schematic driven or high level language based design methodologies. In fact, logic synthesis tools were originally designed for and produce the most efficient results when targeting gate level devices.

High MPA1000 register count and controlled clock skew is ideal for designs employing pipelining techniques such as communications. The unique set of MPA1000 I/O programming options make these devices suitable for industrial and computer interfacing circuits.

MPA17000 Serial EPROMs

The MPA17128, MPA1765 serial OTP EPROMs provide a compact, low pin count, non-volatile configuration store for MPA1000 devices.

MPA17000 devices can be cascaded for increased memory capacity when needed. They are available in the standard 8-pin plastic DIP (N suffix), 8-pin SOIC (D suffix) and 20-pin PLCC (FN suffix) packages.

- Configuration EPROM for MPA1000 Devices
- Voltage Range — 4.5 to 6.0V
- Maximum Read Current of 10mA
- Standby Current of 10µA, Typical
- Industry Standard Synchronous Serial Interface
- Full Static Operation
- 10MHz Maximum Clock Rate at 5.0V
- Programmable Polarity on Hardware Reset
- Programs With Industry Standard Programmers
- Electrostatic Discharge Protection > 2000 Volts
- 8-Pin PDIP and SOIC; 20-Pin PLCC Packages
- Commercial (0 to +70°C) and Industrial (-40 to +85°C)

MPA17000 Serial EEPROM

The MPA17C256 is an easy to use and cost effective serial configuration memory ideally suited for use with today's popular SRAM based FPGAs. The MPA17C256 is available in 8-pin PDIP and 20-pin SOIC and PLCC packages, adhering to industry standard pinouts. The device interfaces downstream FPGA(s) with a very simple enable, clock and data interface. The MPA17C256 is reprogrammable with no need for a higher programming "super voltage"; it may even be reprogrammed on board. The MPA17C256 also has user programmable RESET/OE polarity.

- EE Programmable 262,144 x 1 bit Serial Memories Designed to Store Configuration Programs for FPGAs
- Simple Interface to SRAM FPGAs
- Cascadable to Support Additional Configurations or Future Higher Density FPGAs
- Low Power CMOS EEPROM Process
- Programmable Reset Polarity
- Available in Space Efficient 8-Pin PDIP, 20-Pin SOIC and 20-Pin PLCC Packages
- In-System Programmable via 2-Wire Bus

Controlling the MPA17C256 Serial EEPROM

Most connections between the FPGA device and the Serial EEPROM are simple and self-explanatory:

- The DATA output of the MPA17C256 drives DIN of the FPGA devices
- The master FPGA DCLK output drives the CLK input of the MPA17C256
- The CEO output of the first MPA17C256 drives the CE input of the next MPA17C256 in a cascade chain of EEPROMs.
- SER_EN must be connected to VCC
- CE enables the chip and is required to enable the DATA output pin
- RESET/OE is chip reset and is part of the DATA output enable structure

Dual 64–Bit Static Shift Register	CMOS	MC14517B	–	16	P	DW
Successive Approximation Register	CMOS	MC14549B	–	16	P,L	DW
	CMOS	MC14559B	–	16	P,L	DW
Universal 4–Bit Shift Register	TTL	SN54LS195A	SN74LS195A	16	N,J	D
SYNTHESIZERS						
1.1GHz Serial Input Synthesizer With +64/65, +128/129 Prescaler	ECL	MC12202	–	16,20		D,M,DT
125–1000MHz Frequency Synthesizer With Parallel Programming Interface	ECL	MC12181	–	16		DT
2.0GHz Serial Input Synthesizer With +64/65, +128/129 Prescaler	ECL	MC12206	–	16,20		D,DT
2.5GHz Serial Input Synthesizer With +32/33, +64/65 Prescaler	ECL	MC12210	–	16,20		D,DT
2.7GHz Frequency Synthesizer	ECL	MC12179	–	8		D
TRANSCEIVERS						
25Ω Octal Bidirectional Transceiver w/ 3–State Inputs and Outputs	ECL	MC74F2245	–	20		DW,SD
4–Bit Differential ECL Bus/TTL Bus Transceiver	ECL	MC10H680	MC100H680	28		FN
Dual Supply Octal Translating Transceiver	CMOS	MC74LVX4245	–	24		DW,DT
ECL/TTL Inverting Bidirectional Transceivers With Latch (4–Bit)	ECL	MC10804	–	16	L	
ECL/TTL Inverting Bidirectional Transceivers With Latch (5–Bit)	ECL	MC10805	–	20	L	
Hex ECL/TTL Transceiver With Latches	ECL	MC10H681	MC100H681	28		FN
Low–Voltage CMOS 16–Bit Latching Transceiver, 3–State, Non–Inverting With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX16543A	–	56		DT
Low–Voltage CMOS 16–Bit Transceiver, 3–State, Non–Inverting With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX16245	–	48		DT
Low–Voltage CMOS 18–Bit Universal Bus Transceiver, 3–State, Non–Inverting With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX16500	–	56		DT
	CMOS	MC74LCX16501	–	56		DT
Low–Voltage CMOS Octal Registered Transceiver With Dual Output and Clock Enables, With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX2952	–	24		DW,SD,DT
Low–Voltage CMOS Octal Transceiver, 3–State, Non–Inverting With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX245	–	20		M,DW,DT
Low–Voltage Quiet CMOS Octal Transceiver, 3–State, Non–Inverting	CMOS	MC74LVQ245	–	20		M,DW,SD,DT
Low–Voltage CMOS Octal Transceiver/Registered Transceiver With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX646	–	24		DW,SD,DT
Low–Voltage CMOS Octal Transceiver/Registered Transceiver With Dual Enable, With 5V Tolerant Inputs and Outputs	CMOS	MC74LCX652	–	24		DW,DT
Low–Voltage Quiet CMOS Octal Transceiver/Registered Transceiver	CMOS	MC74LVQ646	–	24		DW,SD,DT
Low–Voltage Quiet CMOS Octal Transceiver/Registered Transceiver	CMOS	MC74LVQ652	–	24		DW,SD,DT
Octal Bus Transceiver/Inverting With Open Collector	TTL	SN54LS642	SN74LS642	20	N,J	DW
Octal Bus Transceiver/Non–Inverting With Open Collector	TTL	SN54LS641	SN74LS641	20	N,J	DW
Quad Futurebus Backplane Transceiver, With 3–State Outputs and Open Collector	TTL	MC74F3893A	–	20		FN
TRANSLATORS						
9–Bit ECL/TTL Translator	ECL	MC10H601	MC100H601	28		FN
9–Bit Latch ECL/TTL Translator	ECL	MC10H603	MC100H603	28		FN
9–Bit Latch TTL/ECL Translator	ECL	MC10H602	MC100H602	28		FN
9–Bit TTL/ECL Translator	ECL	MC10H600	MC100H600	28		FN
Differential ECL/TTL Translator	ECL	MC10ELT25	MC100ELT25	8		D
Differential PECL/TTL Translator	ECL	MC10ELT21	MC100ELT21	8		D
Dual Differential PECL/TTL Translator	ECL	MC100ELT23	–	8		D
Dual LVTTTL/LVC MOS to Differential PECL Translator	ECL	MC100LVELT22	–	8		D
Dual TTL/Differential PECL Translator	ECL	MC10ELT22	MC100ELT22	8		D

NOTES:

- DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.
- DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.
- DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.
- DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
- CONTROLLING DIMENSION: INCH.
- THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
- DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).

DETAIL C

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
 2. CONTROLLING DIMENSION: MILLIMETER.
 3. DATUM PLANE -H- IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
 4. DATUMS -A-, -B- AND -D- TO BE DETERMINED AT DATUM PLANE -H-.
 5. DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE -C-.
 6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -H-.
 7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 (0.003) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

Surface Mount

Why Surface Mount?

Surface Mount Technology is utilized to offer answers to many problems that have been created in the use of insertion technology.

Limitations have been reached with insertion packages and PC board technology. Surface Mount Technology offers the opportunity to continue to advance the state-of-the-art designs that cannot be accomplished with Insertion Technology.

Surface Mount Packages allow more optimum device performance with the smaller Surface Mount configuration. Internal lead lengths, parasitic capacitance and inductance that placed limitations on chip performance have been reduced.

The lower profile of Surface Mount Packages allows more boards to be utilized in a given amount of space. They are

stacked closer together and utilize less total volume than insertion populated PC boards.

Printed circuit costs are lowered with the reduction of the number of board layers required. The elimination or reduction of the number of plated through holes in the board, contributes significantly to lower PC board prices.

Automatic placement equipment is available that can place Surface Mount components at the rate of a few thousand per hour to hundreds of thousands of components per hour.

Surface Mount Technology is cost effective, allowing the manufacturer the opportunity to produce smaller units and/or offer increased functions with the same size product.

Surface Mount assembly does not require the preparation of components that are common on insertion technology lines. Surface Mount components are sent directly to the assembly line, eliminating an intermediate step.
