

## EB-TA2041

# CLASS-T DIGITAL AUDIO AMPLIFIER 4 CHANNEL TA2041 EVALUATION BOARD

Technical Information – Board Revision 2.1

Revision 1.1 – January 2003

### GENERAL DESCRIPTION

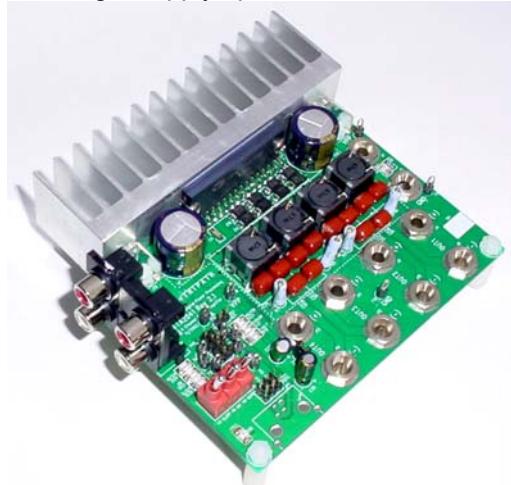

The EB-TA2041 Revision 2.0 is a 4-channel evaluation board based on the TA2041 digital audio power amplifier chipset from Tripath Technology. This board is designed to provide a simple and straightforward environment for the evaluation of the TA2041 amplifier driver. For additional documentation on the TA2041, see the TA2041 Data Sheet.

### APPLICATIONS

- Automotive Head Units
- DVD Receivers
- Multimedia Speaker Systems

### BENEFITS

- 4-channel (280W) solution – with integrated FETs - in a single 32-pin SSIP package
- High fidelity, high efficiency Class-T
- Low external component count
- Single-supply operation

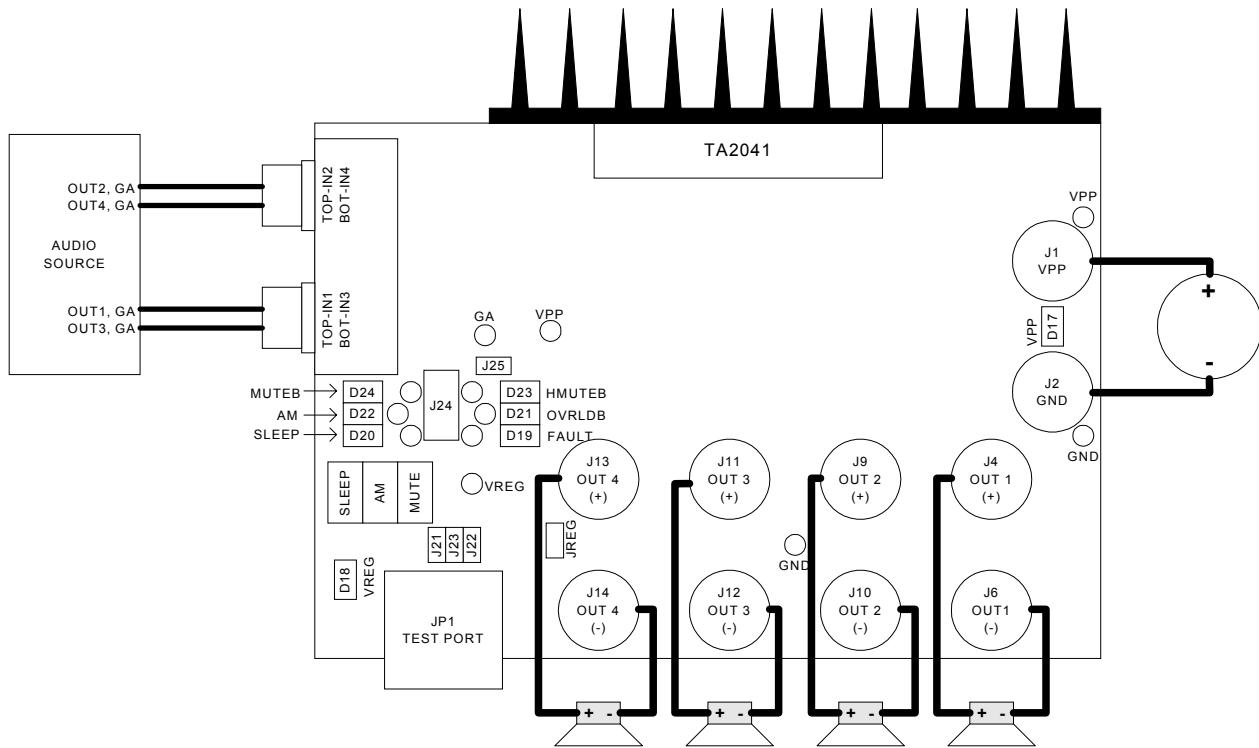

### FEATURES

- Class-T architecture
- Four H-Bridge outputs
- "Audiophile" Sound Quality
- High Power @20.0V
  - $70W_{sat. \text{ sq. wave}} @ 4\Omega$
  - $50W @ 4\Omega, 10\% \text{ THD+N}$
- "Audiophile" Quality Sound
  - $0.04\% \text{ THD+N} @ 30W 4\Omega$
  - $0.18\% \text{ IHF-IM} @ 5W 4\Omega$
- High Efficiency
  - $89\% @ 25W 8\Omega$
  - $85\% @ 50W 4\Omega$
- AM "Low EMI" mode
- Pop-Free startup and shutdown
- High Dynamic Range
- Mute and Stand-By function
- Automatic DC Offset Trim
- Clip Detection Output
- Protection Modes:
  - Output Short to VPP and Ground
  - Output Short across Load
  - Fortuitous Open Ground
  - Load Dump Protection
  - Over-/Under-Voltage Protection
  - Over-current Protection
  - Over-temperature Protection
- Low Noise Floor: <135uV A-weighted

## OPERATING INSTRUCTIONS

### BOARD CONNECTION DIAGRAM

### POWER SUPPLIES

The EB-TA2041 operates on a single supply voltage (VPP referenced to GND) ranging from 9.5-21V. The VPP and GND connectors are standard female banana jacks. The VPP LED will glow green when the VPP supply is on. Please refer to the Board Connection Diagram for the connector locations on the EB-TA2041.

The EB-TA2041 has an on board 3.3V regulator (U2) that operates off of the VPP rail. It produces VREG referenced to GA. The VREG jumper connects the on board 3.3V regulator to the rest of the circuit. It must be shorted for normal operation. It can be opened for use with an external 3.3-5V power supply. J25 connects pin 7 of J24 to VREG. This allows an external control fixture connected to J24 to supply VREG to the board instead of the on board regulator. The VREG LED will glow green when VREG is powered up.

The VREG ground (GA) must not be connected externally to the VPP ground (GND). GND and GA are joined at a common point on the EB-TA2041 with a trace.

### OUTPUTS

The output connections for each channel of the EB-TA2041 are made with standard female banana jacks. The output of the TA2041 is differential; therefore each output has a positive output and a negative output.

Do not short the negative outputs to ground. Do not ground one side of the speaker. Please refer to the Board Connection Diagram for the connector locations on the EB-TA2041.

## INPUTS

The input connection for each channel of the EB-TA2041 is a female RCA jack. The RCA connectors are labeled IN1 through IN4. These inputs share a common ground referenced to GA. Please refer to the Board Connection Diagram for the connector locations on the EB-TA2041.

## LOGIC SIGNALS

The TA2041 has six logic signals. MUTEB, AM, and SLEEP are inputs. HMUTEB, OVRLDB, and FAULT are outputs.

The EB-TA2041 has LED's connected to each of the six logic signals: The MUTEB LED will glow red when the MUTEB signal is driven active low by the MUTE switch. The AM LED will glow yellow when the AM signal is driven active high by the AM switch. The SLEEPB LED will glow red when the SLEEPB signal is driven active low by the SLEEP switch.

Each logic signal has a test pin connected to it. These test pins are located next to the corresponding signal's LED.

J24 may be used to connect an external microcontroller to the logic signals. If driving the input signals externally, R4, R6 and R8 should be removed to prevent bus contention with the switches. Please refer to the schematic for details.

Please refer to the TA2041 Data Sheet for a complete description of the logic signals. Please refer to the Board Connection Diagram for the LED and connector locations on the EB-TA2041.

## AMPLIFIER GAIN

The gain of the TA2041 is internally set to 26dB.

## TEST PORT

JP1 is a test port for internal testing. It is not supported. J21, J22, and J23 are for internal testing and must be left open.

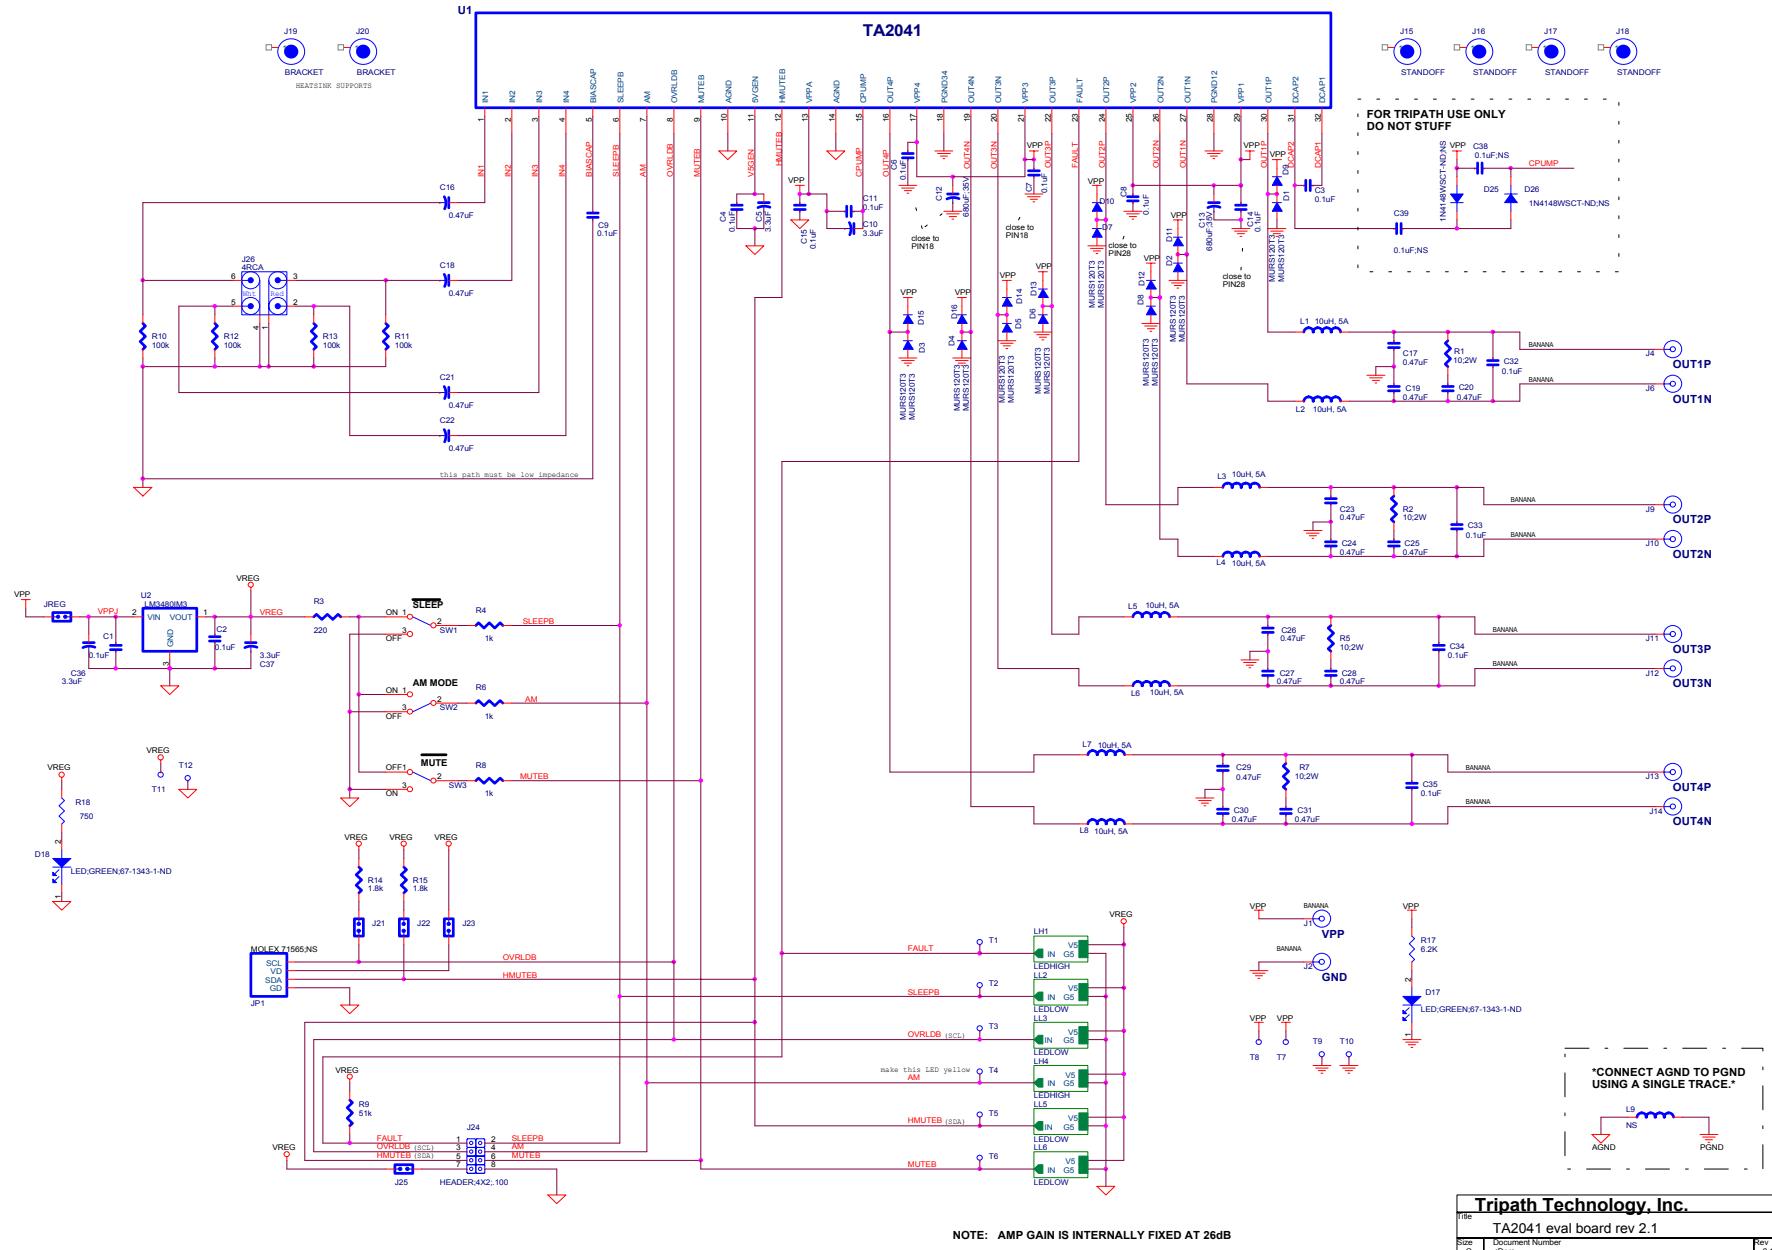

## Performing Measurements on the EB-TA2041:

The TA2041 operates by generating a high frequency switching signal based on the audio input. This signal is sent through a low-pass filter that recovers an amplified version of the audio input. The frequency of the switching pattern is spread spectrum in nature and typically varies between 100kHz and 1MHz, which is well above the 20Hz – 20kHz audio band. The pattern itself does not alter or distort the audio input signal, but it does introduce some inaudible components.

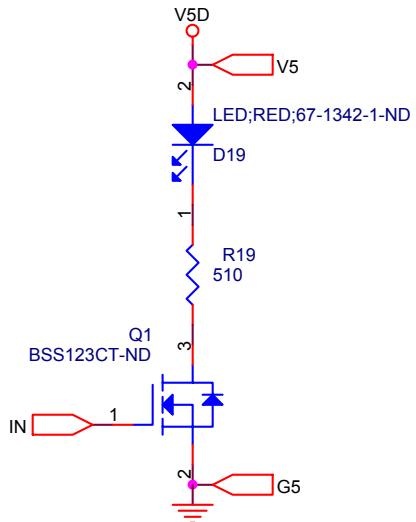

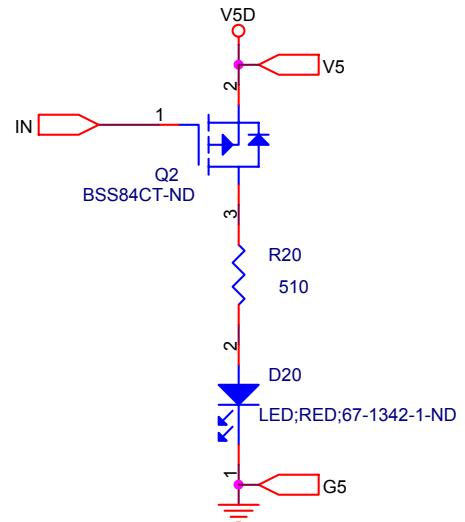

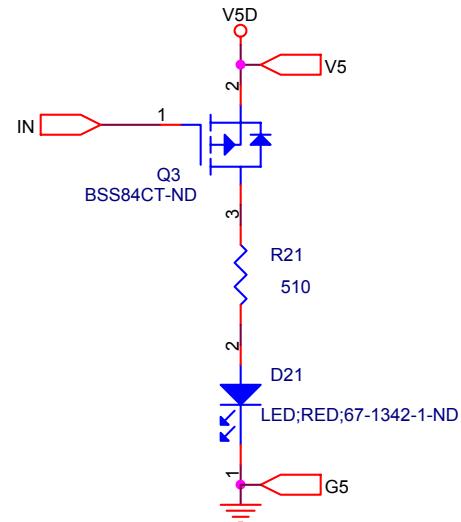

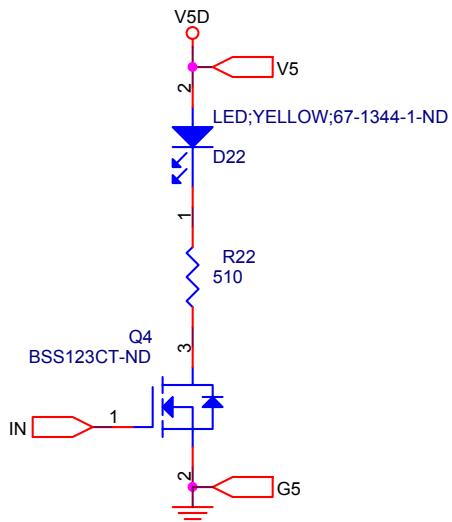

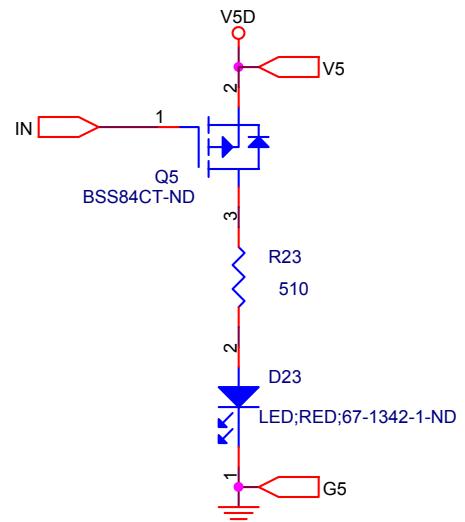

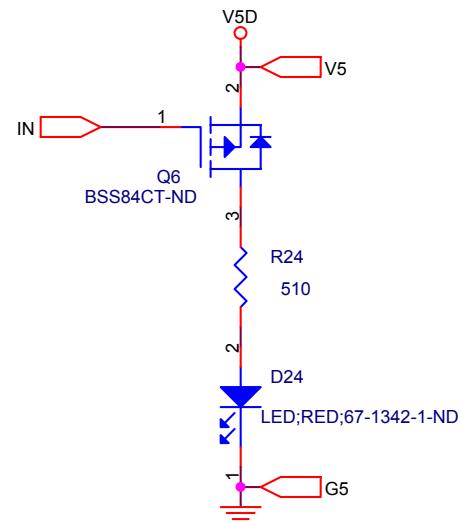

The measurements of certain performance parameters, particularly noise related specifications such as THD+N, are significantly affected by the design of the low-pass filter used on the output as well as the bandwidth setting of the measurement instrument used. Unless the filter has a very sharp roll-off just beyond the audio band or the bandwidth of the measurement instrument is limited, some of the inaudible noise components introduced by the TA2041 amplifier switching pattern will degrade the measurement by including out of band (audio) energy.

One feature of the TA2041 is that it does not require large multi-pole filters to achieve excellent performance in listening tests, usually a more critical factor than performance measurements. Though using a multi-pole filter may remove high-frequency noise and improve THD+N type measurements (when they are made with wide-bandwidth measuring equipment), these same filters degrade frequency response. The EB-TA2041 has a simple two-pole output filter with excellent performance in listening tests. (See Application Note 4 for additional information on bench testing)

## EB-TA2041 SCHEMATIC
