**TIMING DIAGRAM**
**READ CYCLE 1 ( Note 1, 4 )**

**READ CYCLE 2 ( Note 1, 2, 4 ) ( CS2=Vih )**

**READ CYCLE 3 ( Note 1, 2, 4 ) ( CS2=Vih )**

**Notes :**

1. Read Cycle occurs whenever a high on the /WE and /OE is low, while /UB and/or /LB and /CS1 and CS2 are in active status.
2. /OE = V<sub>IL</sub>
3. tCHZ, tBHZ and tOHZ are defined as the time at which the outputs achieve the high impedance state and tOLZ, tBLZ and tCLZ are defined as the time at which the outputs achieve the low impedance state. These are not referenced to output voltage levels.
4. /CS1 in high for the standby, low for active.  
/UB and /LB in high for the standby, low for active.

**WRITE CYCLE 1 ( Note 1, 4, 5, 9, 10 ) ( /WE Controlled )**

**WRITE CYCLE 2 ( Note 1, 4, 5, 9, 10 ) ( /CS1 Controlled )**

**Notes :**

1. A write occurs during the overlap of low /CS1, low /WE and low /UB and/or /LB.
2.  $t_{WR}$  is measured from the earlier of /CS1, /LB, /UB, or /WE going high to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the output must not be applied.
4. If the /CS1, /LB and /UB low transition occur simultaneously with the /WE low transition or after the /WE transition, outputs remain in a high impedance state.
5. /OE is continuously low (/OE= $V_{IL}$ )
6. Q(data out) is the invalid data.
7. Q(data out) is the read data of the next address.
8.  $t_{WHZ}$  is defined as the time at which the outputs achieve the high impedance state. It is not referenced to output voltage levels.
9. /CS1 in high for the standby, low for active. /UB and /LB in high for the standby, low for active.
10. Do not input data to the I/O pins while they are in the output state.

## AVOID TIMING

Hynix 1T/1C SRAM has a timing which is not supported at read operation. If your system has multiple invalid address signal shorter than  $t_{RC}$  during over 10us at read operation which showed in abnormal timing, Hynix 1T/1C SRAM needs a normal read timing at least during 10us which showed in avoidable timing(1) or toggle the  $/CS1$  to high ( $\geq t_{RC}$ ) one time at least which showed in avoidable timing(2)
