

# Z86C21

## 8K ROM Z8<sup>®</sup> CMOS MICROCONTROLLER

### FEATURES

- 8-Bit CMOS MCU with 8 Kbytes of ROM
- 256 Byte Register File
  - 236 Bytes of General-Purpose RAM
  - 16 Bytes Control/Status Registers
  - 4 Bytes for Ports
- 40-Pin DIP, 44-Pin PLCC or 44-Pin QFP Package
- 4.5V to 5.5V Operating Range
- Low Power Consumption: 220 mW (max) @ 16 MHz
- Fast instruction pointer: 1.0  $\mu$ s @ 12 MHz
- Two Standby Modes: STOP and HALT
- 32 Input/Output Lines
- Full-Duplex UART
- All Digital Inputs are TTL Levels
- Auto Latches
- RAM and ROM Protect
- Two Programmable 8-Bit Counter/Timers each with 6-Bit Programmable Prescaler.
- Six Vectored, Priority Interrupts from Eight Different Sources
- Clock Speeds: 12 and 16 MHz
- On-Chip Oscillator that Accepts a Crystal, Ceramic Resonator, LC, or External Clock Drive.

### GENERAL DESCRIPTION

The Z86C21 microcontroller is a member of the Z8 single-chip microcontroller family with 8 Kbytes of ROM and 236 bytes of RAM. The device is packaged in a 40-pin DIP, 44-pin PLCC, or a 44-pin QFP with a ROMless pin option available on the 44-pin versions only. With the ROM/ROMless feature selectively, the Z86C21 offers both external memory and preprogrammed ROM, making it well-suited for high-volume applications or where code flexibility is required.

Zilog's CMOS microcontroller offers fast execution, efficient use of memory, sophisticated interrupts, input/output bit manipulation capabilities, and easy hardware/software system expansion along with low cost and low power consumption.

The Z86C21 architecture is characterized by Zilog's 8-bit microcontroller core. The device offers a flexible I/O scheme, an efficient register and address space structure, multiplexed capabilities between address/data, I/O, and a number of ancillary features that are useful in many industrial and advanced scientific applications.

For applications demanding powerful I/O capabilities, the Z86C21 provides 32 pins dedicated to input and output. These lines are grouped into four ports. Each port consists of eight lines, and is configurable under software control to provide timing, status signals, serial or parallel I/O with or without handshake, and an address/data bus for interfacing external memory. There are three basic address spaces available to support this configuration: Program Memory, Data Memory, and 236 general-purpose registers.

## GENERAL DESCRIPTION (Continued)

To unburden the program from coping with the real-time tasks, such as counting/timing and serial data communication, the Z86C21 offers two on-chip counter/timers with a large number of user selectable modes, and an on-board UART.

### Notes:

All Signals with a preceding front slash, "/", are active Low, e.g., B/W (WORD is active Low); /B/W (BYTE is active Low, only).

Power connections follow conventional descriptions below:

Connection	Circuit	Device
Power Ground	$V_{CC}$ GND	$V_{DD}$ $V_{SS}$

**Figure 1. Z86C21 Functional Block Diagram**

## PIN DESCRIPTION

## PIN FUNCTIONS

**/ROMless** (input, active Low). This pin, when connected to GND, disables the internal ROM and forces the device to function as a Z86C91 ROMless Z8. For more details on the ROMless version, refer to the Z86C91 product specification. (**Note:** When left unconnected or pulled high to  $V_{CC}$ , the part functions as a normal Z86C21 ROM version). This pin is only available on the 44-pin versions of the Z86C21.

**/DS** (output, active Low). Data Strobe is activated once for each external memory transfer. For a READ operation, data must be available prior to the trailing edge of /DS. For WRITE operations, the falling edge of /DS indicates that output data is valid.

**/AS** (output, active Low). Address Strobe is pulsed once at the beginning of each machine cycle. Address output is through Port 1 for all external programs. Memory address transfers are valid at the trailing edge of /AS. Under program control, /AS is placed in the high-impedance state along with Ports 0 and 1, Data Strobe, and Read/Write.

**XTAL1, XTAL2** *Crystal 1, Crystal 2* (time-based input and output, respectively). These pins connect a parallel-resonant crystal, ceramic resonator, LC, or any external single-phase clock to the on-chip oscillator and buffer.

**R/W** (output, write Low). The Read/Write signal is Low when the MCU is writing to the external program or data memory.

**/RESET** (input, active Low). To avoid asynchronous and noisy reset problems, the Z86C21 is equipped with a reset filter of four external clocks (4TpC). If the external /RESET signal is less than 4TpC in duration, no reset occurs.

On the fifth clock after the /RESET is detected, an internal RST signal is latched and held for an internal register count of 18 external clocks, or for the duration of the external /RESET, whichever is longer. During the reset cycle, /DS is held active Low while /AS cycles at a rate of TpC2. When /RESET is deactivated, program execution begins at location 000C (HEX). Power-up reset time must be held Low for 50 ms, or until  $V_{CC}$  is stable, whichever is longer.

**Port 0** (P07-P00). Port 0 is an 8-bit, nibble programmable, bidirectional, TTL compatible port. These eight I/O lines can be configured under software control as a nibble I/O port, or as an address port for interfacing external memory. When used as an I/O port, Port 0 may be placed under handshake control. In this configuration, Port 3, lines P32 and P35 are used as the handshake control /DAV0 and RDY0 (Data Available and Ready). Handshake signal assignment is dictated by the I/O direction of the upper nibble P07-P04. The lower nibble must have the same direction as the upper nibble to be under handshake control.

For external memory references, Port 0 can provide address bits A11-A8 (lower nibble) or A15-A8 (lower and upper nibble) depending on the required address space. If the address range requires 12 bits or less, the upper nibble of Port 0 is programmed independently as I/O while the lower nibble is used for addressing. If one or both nibbles are needed for I/O operation, they must be configured by writing to the Port 0 Mode register.

In ROMless mode, after a hardware reset, Port 0 lines are defined as address lines A15-A8, and extended timing is set to accommodate slow memory access. The initialization routine includes reconfiguration to eliminate this extended timing mode (Figure 5).

Figure 5. Port 0 Configuration

## PIN FUNCTIONS (Continued)

**Port 1** (P17-P10). Port 1 is an 8-bit, byte programmable, bidirectional, TTL compatible port. It has multiplexed Address (A7-A0) and Data (D7-D0) ports. For Z86C21, these eight I/O lines can be programmed as Input or Output lines or can be configured under software control as an address/data port for interfacing external memory. When used as an I/O port, Port 1 can be placed under handshake control. In this configuration, Port 3 line P33 and P34 are used as the handshake controls RDY1 and /DAV1.

Memory locations greater than 8192 are referenced through Port 1. To interface external memory, Port 1 is programmed

for the multiplexed Address/Data mode. If more than 256 external locations are required, Port 0 must output the additional lines.

Port 1 can be placed in a high-impedance state along with Port 0, /AS, /DS and R/W, allowing the MCU to share common resource in multiprocessor and DMA applications. Data transfers are controlled by assigning P33 as a Bus Acknowledge input, and P34 as a Bus request output (Figure 6).

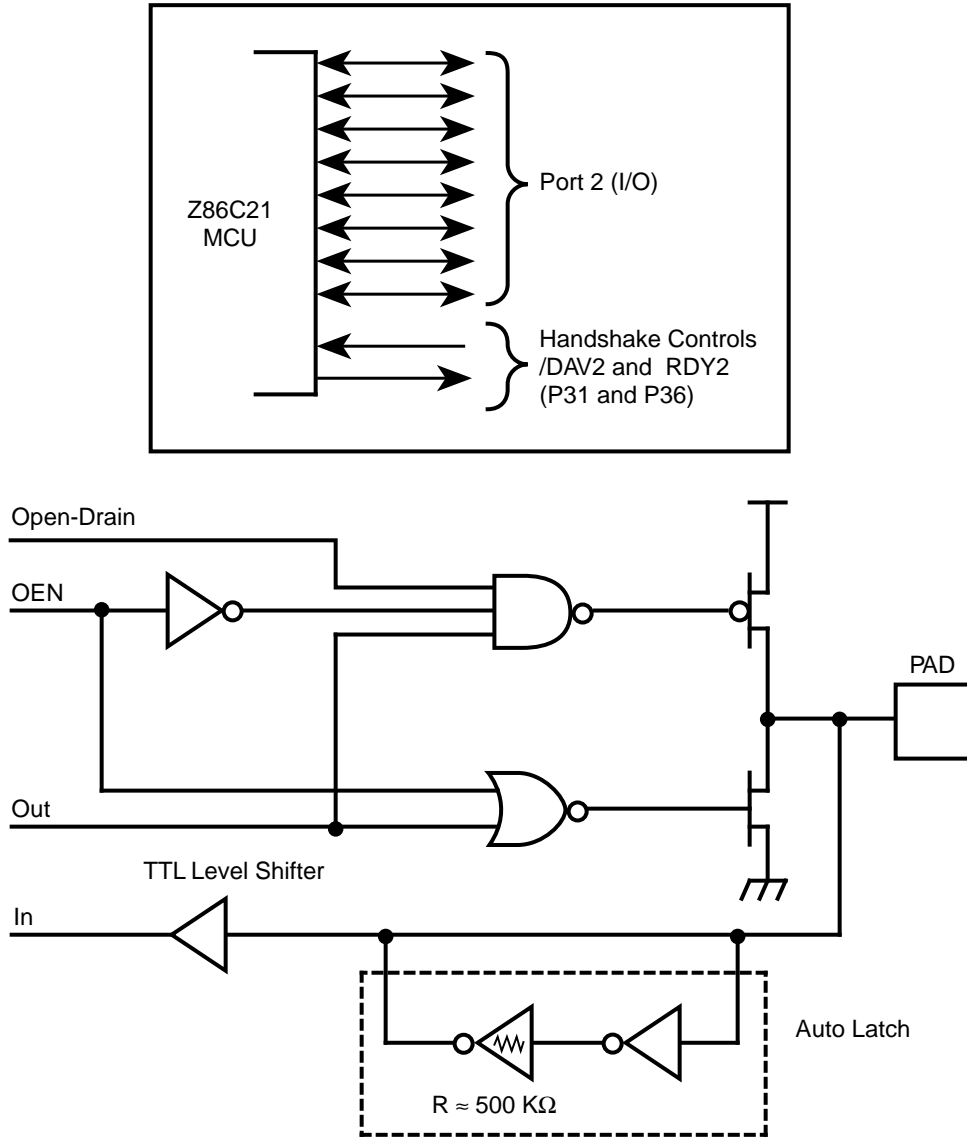

**Figure 6. Port 1 Configuration**

**Port 2 (P27-P20).** Port 2 is an 8-bit, bit programmable, bidirectional, CMOS compatible port. Each of these eight I/O lines can be independently programmed as an input or output or globally as an open-drain output. Port 2 is always available for I/O operation. When used as an I/O port, Port 2 may be placed under handshake control. In this

configuration, Port 3 lines P31 and P36 are used as the handshake control lines /DAV2 and RDY2. The handshake signal assignment for Port 3 lines P31 and P36 is dictated by the direction (input or output) assigned to P27 (Figure 7).

**Figure 7. Port 2 Configuration**

**PIN FUNCTIONS** (Continued)

**Port 3** (P37-P30). Port 3 is an 8-bit, CMOS compatible four-fixed-input and four-fixed-output port. These eight I/O lines have four-fixed input (P33-P30) and four fixed output (P37-P34) ports. Port 3, when used as serial I/O, is programmed as serial in and serial out, respectively (Figure 8 and Table 4) Port 3 pins have Auto Latches only.

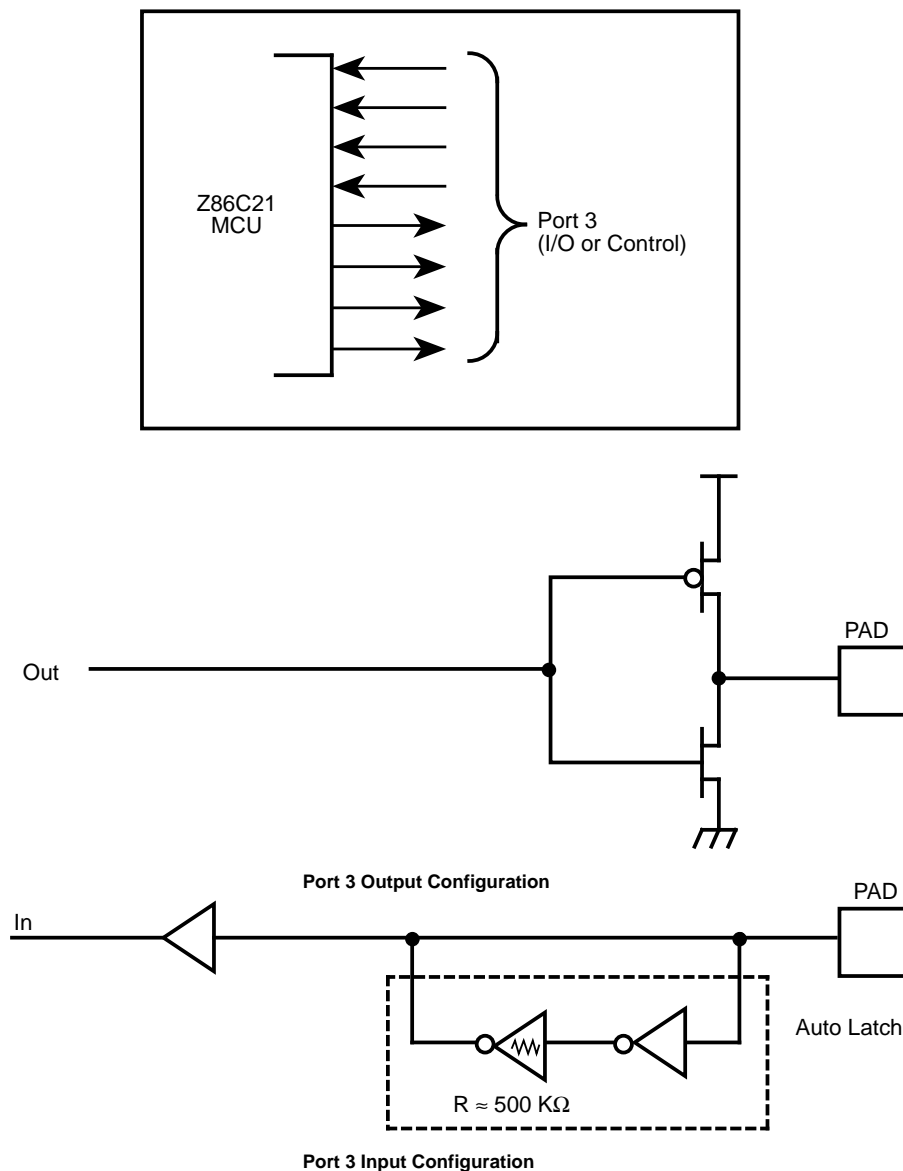

Port 3 is configured under software control to provide the following control functions: handshake for Ports 0 and 2 (/DAV and RDY); four external interrupt request signals (IRQ3-IRQ0); timer input and output signals ( $T_{IN}$  and  $T_{OUT}$ ), and Data Memory Select (/DM).

**UART Operation.** Port 3 lines P30 and P37, are be programmed as serial I/O lines for full-duplex serial asynchro-

nous receiver/transmitter operation. The bit rate is controlled by the Counter/Timer0.

The Z86C21 automatically adds a start bit and two stop bits to transmitted data (Figure 9). Odd parity is also available as an option. Eight data bits are always transmitted, regardless of parity selection. If parity is enabled, the eighth bit is the odd parity bit. An interrupt request (IRQ4) is generated on all transmitted characters.

Received data must have a start bit, eight data bits and at least one stop bit. If parity is on, bit 7 of the received data is replaced by a parity error flag. Received characters generate the IRQ3 interrupt request.

**Figure 8. Port 3 Configuration**

**Table 4. Port 3 Pin Assignments**

Pin	I/O	CTC1	Int.	P0 HS	P1 HS	P2 HS	UART	Ext
P30	IN		IRQ3				Serial In	
P31	IN	T <sub>IN</sub>	IRQ2			D/R		
P32	IN		IRQ0	D/R				
P33	IN		IRQ1		D/R			
P34	OUT				R/D			DM
P35	OUT			R/D				
P36	OUT	T <sub>OUT</sub>				R/D		
P37	OUT						Serial Out	
T0			IRQ4					
T1			IRQ5					

**Notes:**

HS = Handshake Signals; D = Data Available; R = Ready

**Auto Latch.** The Auto Latch puts valid CMOS levels on all CMOS inputs that are not externally driven. This reduces excessive supply current flow in the input buffer when it is not been driven by any source.

**Low EMI Option.** The Z86C21 is available in a Low EMI option. This option is mask-programmable, to be selected by the customer at the time when the ROM code is submitted. Use of this feature results in:

- The pre-drivers slew rate reduced to 10 ns typical.
- Low EMI output drivers have resistance of 200 Ohms typical.
- Oscillator divide-by-two circuitry is eliminated.
- Internal SCLK/TCLK operation is limited to a maximum of 4 MHz (250 ns cycle time)

Transmitted Data (No Parity)

Received Data (No Parity)

Transmitted Data (With Parity)

Received Data (With Parity)

**Figure 9. Serial Data Formats**

## FUNCTIONAL DESCRIPTION

### Address Space

**Program Memory.** The Z86C21 can address up to 56K bytes of external program memory (Figure 10). The first 12 bytes of program memory are reserved for the interrupt vectors. These locations contain six 16-bit vectors that correspond to the six available interrupts. For ROM mode, byte 13 to byte 8191 consists of on-chip ROM. At addresses 8192 and greater, the Z86C21 executes external program memory fetches. In the ROMless mode, the Z86C21 can address up to 64K bytes of external program memory. Program execution begins at external location 000C (HEX) after a reset.

**Data Memory (/DM).** The ROM version can address up to 56K bytes of external data memory space beginning at location 8192. The ROMless version can address up to 64K bytes of external data memory. External data memory can be included with, or separated from, the external program memory space. /DM, an optional I/O function that can be programmed to appear on P34, is used to distinguish between data and program memory space (Figure 11). The state of the /DM signal is controlled by the type instruction being executed. An LDC opcode references PROGRAM (/DM inactive) memory, and an LDE instruction references DATA (/DM active Low) memory.

**Figure 10. Program Memory Configuration**

**Figure 11. Data Memory Configuration**

**Register File.** The Register File consists of four I/O port registers, 236 general-purpose registers and 16 control and status registers (Figure 12). The instructions can access registers directly or indirectly through an 8-bit address field. The Z86C21 also allows short 4-bit register addressing using the Register Pointer (Figure 13). In the 4-bit mode, the Register File is divided into 16 working

register groups, each occupying 16 continuous locations. The Register Pointer addresses the starting location of the active working-register group. For the reset and power-up conditions of the Register File, see Figure 14.

**Note:** Register Bank E0-EF can only be accessed through working registers and indirect addressing modes.

LOCATION		IDENTIFIERS	
R255	Stack Pointer (Bits 7-0)	SPL	
R254	Stack Pointer (Bits 15-8)	SPH

FUNCTIONAL DESCRIPTION (Continued)

Figure 14. RAM Register File Reset Condition

**RAM Protect.** The upper portion of the RAM's address spaces 80FH to EFH (excluding the control registers) can be protected from reading and writing. The RAM Protect bit option is mask-programmable and is selected by the customer when the ROM code is submitted. After the mask option is selected, the user activates from the internal ROM code to turn off/on the RAM Protect by loading a bit D6 in the IMR register to either a 0 or a 1, respectively. A 1 in D6 indicates RAM Protect enabled.

**ROM Protect.** The first 8 Kbytes of program memory is mask programmable. A ROM protect feature prevents dumping of the ROM contents by inhibiting execution of LDC, LDCI, LDE, and LDEI instructions to Program Memory in all modes.

The ROM Protect option is mask-programmable, to be selected by the customer at the time when the ROM code is submitted.

**Note:** With RAM/ROM protect on, the Z86C21 cannot access the memory space.

**Stack.** The Z86C21 has a 16-bit Stack Pointer (R254-R255) used for external stack that resides anywhere in the data memory for the ROMless mode, but only from 8192 to 65535 in the ROM mode. An 8-bit Stack Pointer (R255) is used for the internal stack that resides within the 236 general-purpose registers (R4-R239). The high byte of the Stack Pointer (SPH-Bit 8-15) is used as a general-purpose register when using internal stack only.

**Counter/Timers.** There are two 8-bit programmable counter/timers (T0-T1), each driven by its own 6-bit programmable prescaler. The T1 prescaler is driven by internal or external clock sources; however, the T0 prescaler is driven by the internal clock only (Figure 15).

The 6-bit prescalers divides the input frequency of the clock source by any integer number from 1 to 64. Each prescaler drives its counter, which decrements the value (1 to 256) that has been loaded into the counter. When both the counter and prescaler reach the end of the count, a timer interrupt request, IRQ4 (T0) or IRQ5 (T1), is generated.

The counter can be programmed to start, stop, restart to continue, or restart from the initial value. The counters can

also be programmed to stop upon reaching zero (single pass mode) or to automatically reload the initial value and continue counting (modulo-n continuous mode).

The counter, but not the prescalers, can be read at any time without disturbing their value or count mode. The clock source for T1 is user-definable and can be either the internal microprocessor clock divided by four, or an external signal input through Port 3. The Timer Mode register configures the external timer input (P31) as an external clock, a trigger input that is retriggerable or non-retriggerable, or as a gate input for the internal clock. Port 3, line P36, also serves as a timer output ( $T_{OUT}$ ) through which T0, T1 or the internal clock is output. The counter/timers are cascaded by connecting the T0 output to the input of T1.

Figure 15. Counter/Timers Block Diagram

**FUNCTIONAL DESCRIPTION** (Continued)

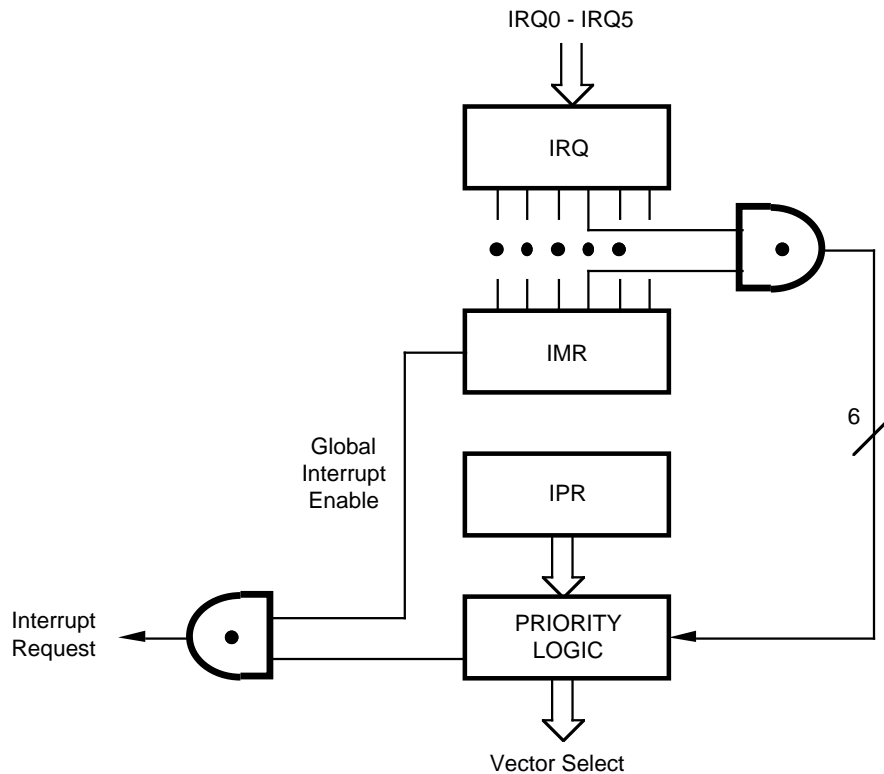

**Interrupts.** The Z86C21 has six different interrupts from eight different sources. The interrupts are maskable and prioritized. The eight sources are divided as follow: four sources are claimed by Port 3, lines P33-P30; one in Serial Out, one in Serial In, and two in the counter/timers (Figure 16). The Interrupt Mask Register globally or individually enables or disables the six interrupt requests. When more than one interrupt is pending, priorities are resolved by a programmable priority encoder that is controlled by the Interrupt Priority register. (Refer to Table 4.)

All Z86C21 interrupts are vectored through locations in the program memory. When an interrupt machine cycle is activated, an interrupt request is granted. Thus, this disables all of the subsequent interrupts, save the Program Counter and Status Flags, and then branches to the program memory vector location reserved for that interrupt. This memory location and the next byte contain the 16-bit address of the interrupt service routine for that particular interrupt request.

To accommodate polled interrupt systems, interrupt inputs are masked and the Interrupt Request register is polled to determine which of the interrupt requests need service. Software initiated interrupts are supported by setting the appropriate bit in the Interrupt Request Register (IRQ).

Internal interrupt requests are sampled on the falling edge of the last cycle of every instruction, and the interrupt request must be valid 5TpC before the falling edge of the last clock cycle of the currently executing instruction.

For the ROMless mode, when the device samples a valid interrupt request, the next 48 (external) clock cycles are used to prioritize the interrupt, and push the two PC bytes and the FLAG register on the stack. The following nine cycles are used to fetch the interrupt vector from external memory. The first byte of the interrupt service routine is fetched beginning on the 58th TpC cycle following the internal sample point, which corresponds to the 63rd TpC cycle following the external interrupt sample point.

**Figure 16. Interrupt Block Diagram**

**Clock.** The Z86C21 on-chip oscillator has a high-gain, parallel-resonant amplifier for connection to a crystal, LC, ceramic resonator, or any suitable external clock source (XTAL1 = Input, XTAL2 = Output). The crystal should be AT cut, 1 MHz to 16 MHz max, and series resistance (RS) is less than or equal to 100 Ohms. The crystal should be connected across XTAL1 and XTAL2 using the recom-

mended capacitors ( $10\text{ pF} < C_L < 300\text{ pF}$ ) from each pin 11, ground instead of just system ground. This prevents noise injection into the clock input (Figure 17).

**Note:** Actual capacitor value is specified by the crystal manufacturer.

**Figure 17. Oscillator Configuration**

**HALT.** Turns off the internal CPU clock but not the XTAL oscillation. The counter/timers and the external interrupts IRQ0, IRQ1, IRQ2, and IRQ3 remain active. The device is recovered by interrupts, either externally or internally generated. An interrupt request must be executed (enabled) to exit HALT mode. After the interrupt service routine, the program continues from the instruction after the HALT.

**STOP.** This instruction turns off the internal clock and external crystal oscillation and reduces the standby current to  $5\text{ }\mu\text{A}$  (typical) or less. The STOP mode is terminated by a reset which causes the processor to restart the application program at address 000C (HEX).

In order to enter STOP (or HALT) mode, it is necessary to first flush the instruction pipeline to avoid suspending execution in mid-instruction. To do this, the user must execute a NOP (opcode=0FFH) immediately before the appropriate sleep instruction. i.e.,

```
FF NOP ; clear the pipeline
6F STOP ; enter STOP mode
or
FF NOP ; clear the pipeline
7F HALT ; enter HALT mode
```

## ABSOLUTE MAXIMUM RATINGS

Symbol	Description	Min	Max	Units
$V_{CC}$	Supply Voltage*	-0.3	+7.0	V
$T_{STG}$	Storage Temp	-65	+150	°C
$T_A$	Oper Ambient Temp		†	°C

**Notes:**

\* Voltages on all pins with respect to GND.

† See Ordering Information

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; operation of the device at any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for an extended period may affect device reliability.

## STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to GND. Positive current flows into the referenced pin (Figure 18).

**Figure 18. Test Load Diagram**

## DC CHARACTERISTICS

Sym	Parameter	$T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$		$T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$		Typical @ $25^\circ\text{C}$	Units	Conditions

18	TdDM(AS)	/DM Valid to /AS Rise Delay	50		30		50		30		ns	[2,3]

**Notes:**

- [1] When using extended memory timing add 2 TpC.  
 [2] Timing numbers given are for minimum TpC.  
 [3] See clock cycle dependent characteristics table.

Standard Test Load

All timing references use 2.0V for a logic 1 and 0.8V for a logic 0.

#### Clock Dependent Formulas

Number	Symbol	Equation
1	TdA(AS)	$0.40\text{TpC} + 0.32$
2	TdAS(A)	$0.59\text{TpC} - 3.25$
3	TdAS(DR)	$2.83\text{TpC} + 6.14$
4	TwAS	$0.66\text{TpC} - 1.65$
6	TwDSR	$2.33\text{TpC} - 10.56$
7	TwDSW	$1.27\text{TpC} + 1.67$
8	TdDSR(DR)	$1.97\text{TpC} - 42.5$
10	TdDS(A)	$0.8\text{TpC}$
11	TdDS(AS)	$0.59\text{TpC} - 3.14$
12	TdR/W(AS)	$0.4\text{TpC}$
13	TdDS(R/W)	$0.8\text{TpC} - 15$
14	TdDW(DSW)	$0.4\text{TpC}$
15	TdDS(DW)	$0.88\text{TpC} - 19$
16	TdA(DR)	$4\text{TpC} - 20$
17	TdAS(DS)	$0.91\text{TpC} - 10.7$
18	TdDM(AS)	$0.9\text{TpC} - 26.3$

## INSTRUCTION SET NOTATION

**Addressing Modes.** The following notation is used to describe the addressing modes and instruction operations as shown in the instruction summary.

Symbol	Meaning
IRR	Indirect register pair or indirect working-register pair address
lrr	Indirect working-register pair only
X	Indexed address
DA	Direct address
RA	Relative address
IM	Immediate
R	Register or working-register address
r	Working-register address only
IR	Indirect-register or indirect working-register address
lr	Indirect working-register address only
RR	Register pair or working register pair address

**Symbols.** The following symbols are used in describing the instruction set.

Symbol	Meaning
dst	Destination location or contents
src	Source location or contents
cc	Condition code
@	Indirect address prefix
SP	Stack Pointer
PC	Program Counter
FLAGS	Flag register (Control Register 252)
RP	Register Pointer (R253)
IMR	Interrupt mask register (R251)

**Flags.** Control register (R252) contains the following six flags:

Symbol	Meaning
C	Carry flag
Z	Zero flag
S	Sign flag
V	Overflow flag
D	Decimal-adjust flag
H	Half-carry flag

Affected flags are indicated by:

0	Clear to zero
1	Set to one
*	Set to clear according to operation
-	Unaffected
x	Undefined

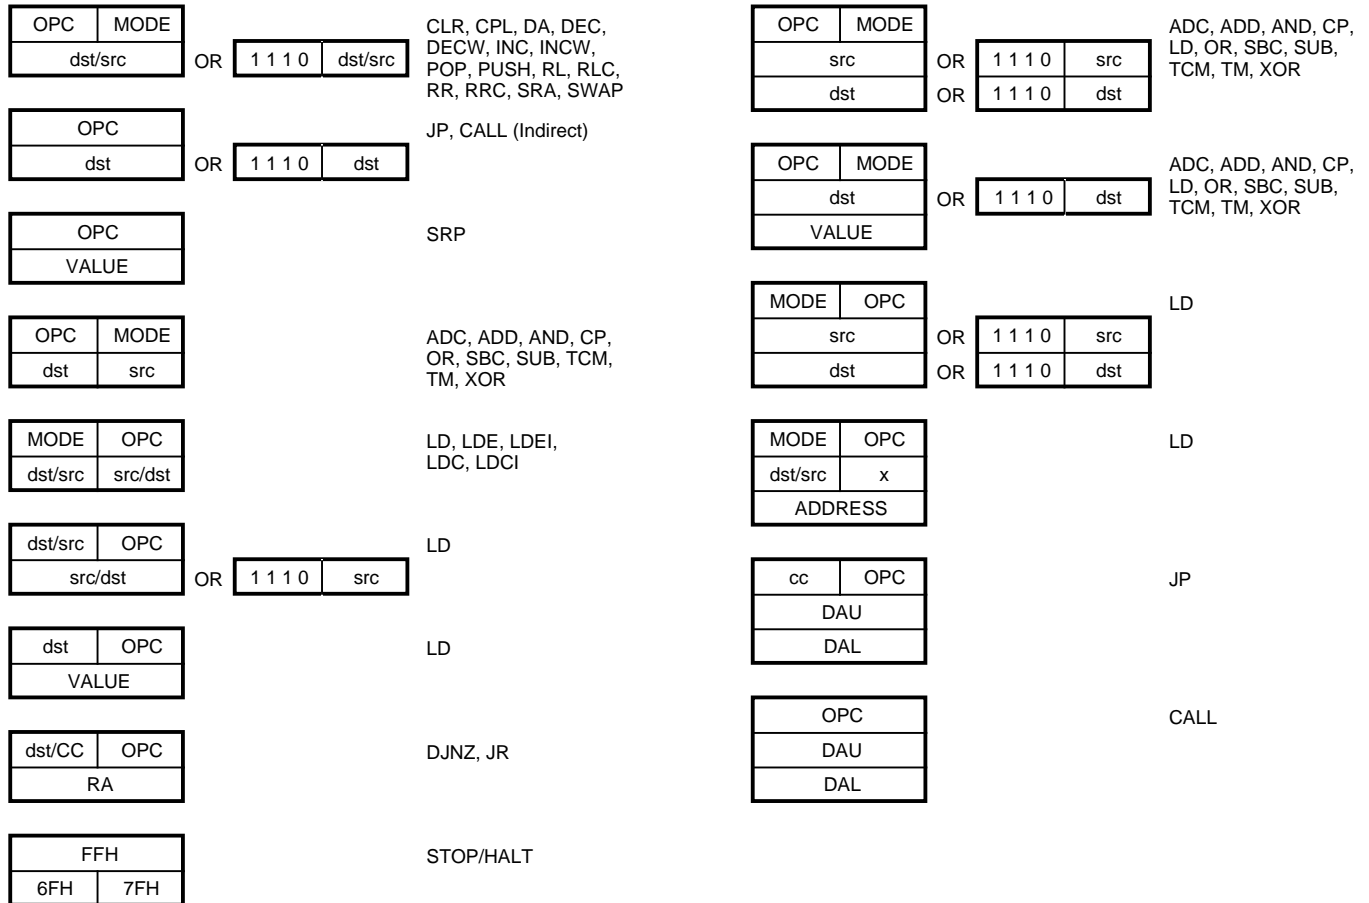

**CONDITION CODES**

<b>Value</b>	<b>Mnemonic</b>	<b>Meaning</b>	<b>Flags Set</b>
1000		Always True	
0111	C	Carry	C = 1
1111	NC	No Carry	C = 0
0110	Z	Zero	Z = 1
1110	NZ	Not Zero	Z = 0
1101	PL	Plus	S = 0
0101	MI	Minus	S = 1
0100	OV	Overflow	V = 1
1100	NOV	No Overflow	V = 0
0110	EQ	Equal	Z = 1
1110	NE	Not Equal	Z = 0
1001	GE	Greater Than or Equal	(S XOR V) = 0
0001	LT	Less than	(S XOR V) = 1
1010	GT	Greater Than	[Z OR (S XOR V)] = 0
0010	LE	Less Than or Equal	[Z OR (S XOR V)] = 1
1111	UGE	Unsigned Greater Than or Equal	C = 0
0111	ULT	Unsigned Less Than	C = 1
1011	UGT	Unsigned Greater Than	(C = 0 AND Z = 0) = 1
0011	ULE	Unsigned Less Than or Equal	(C OR Z) = 1
0000	F	Never True (Always False)	

## INSTRUCTION FORMATS

### One-Byte Instructions

### Two-Byte Instructions

### Three-Byte Instructions

## INSTRUCTION SUMMARY

**Note:** Assignment of a value is indicated by the symbol “←”. For example:

$$\text{dst} \leftarrow \text{dst} + \text{src}$$

indicates that the source data is added to the destination data and the result is stored in the destination location. The

notation “addr (n)” is used to refer to bit (n) of a given operand location. For example:

$$\text{dst} (7)$$

refers to bit 7 of the destination operand.

† These instructions have an identical set of addressing modes, which are encoded for brevity. The first opcode nibble is found in the instruction set table above. The second nibble is expressed symbolically by a '[ ]' in this table, and its value is found in the following table to the left of the applicable addressing mode pair.

For example, the opcode of an ADC instruction using the addressing modes r (destination) and Ir (source) is 13.

Address Mode	dst	src	Lower Opcode Nibble
r	r		[2]
r	Ir		[3]
R	R		[4]
R	IR		[5]
R	IM		[6]
IR	IM		[7]
