ORSB-40U12B RoHS Compliant PRELIMINARY Rev.A

Features

- Isolated
- High Efficiency
- Fixed Frequency
- High Power Density
- Low Cost
- Input Under-voltage Lockout
- Output Voltage Trim
- Class 1, Category 2, Isolated DC/DC Converter (refer to IPC-9592)
- Output Over-voltage Shut Down
- Over Temperature Protection
- OCP/SCP
- Remote ON/OFF
- Positive/Negative Remote Sense
- Basic Insulation

Applications

- Networking
- Computers and peripherals
- Telecommunications

Description

The ORSB-40U12B series is isolated dc/dc converter that operates from a nominal 24 Vdc or 48 Vdc source. These units will provide up to 42 W of output power from an 18 - 75 Vdc wide input range. These units are designed to be highly efficient and low cost. Features include remote on/off, over current protection and under voltage lockout. These converters are provided in an industry standard sixteenth brick package.

Part Selection

Output Voltage	Input Voltage	Max. Output Current	Max. Output Power	Typical Efficiency	Model Number Active Low
12 Vdc	18 Vdc - 75 Vdc	3.5 A	42 W	85%	ORSB-40U12B

Notes: Add "G" suffix at the end of the model number to indicate Tray Packaging.

Part Number Explanation

0 R SB - 40 U 12 B
1 2 3 4 5 6 7

1---Through hole mount

2---RoHS 6, change "R" to "7" means RoHS 5

3---Series name, 1/16 Brick

4---Series code

5---Input range (18-75V)

6---Output voltage (12V)

7---Option, "x" of the model part number to be 0-9, A-Z, which will represent the special request of customer.

Thermal Derating Curve (continued)

The OTP is achieved by thermistor R65 and it is in non-latch mode when the hottest component Q5 reaches 130°C with 100LFM air flow correspondingly. It will restart automatically when the temperature falls down to 110°C. The protecting point will be varied a little under different conditions (air flow, ambient temperature, input voltage, load...).

Output Trim Equations

Equations for calculating the trim resistor are shown below. The Trim Down resistor should be connected between the Trim pin and Ground pin. The Trim Up resistor should be connected between the Trim pin and the Vout. Only one of the resistors should be used for any given application.

$$R_{trimdown} = \frac{511}{|delta|} - 10.22 [k\Omega]$$

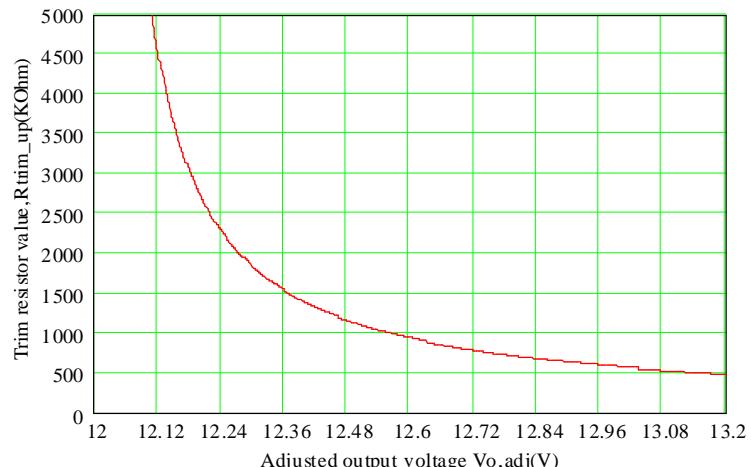

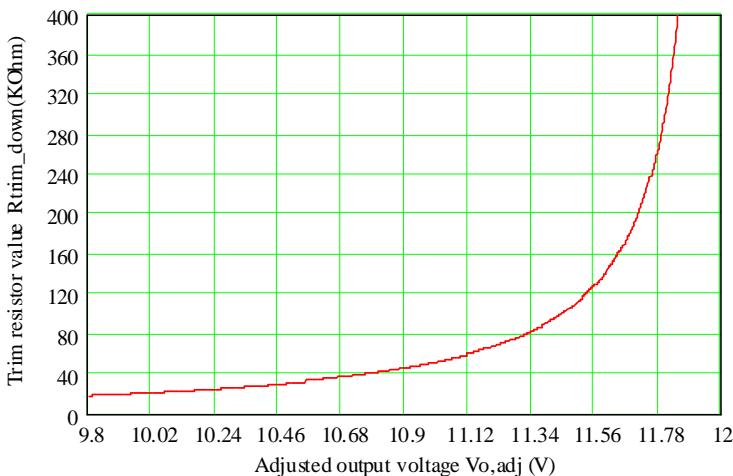

$$R_{trimup} = \frac{(100+delta) \cdot Vo \cdot 5.11 - 626}{1.225 \cdot delta} - 10.22 [k\Omega]$$

Note: $delta = \frac{(Vo_req - Vo)}{Vo} \times 100 [\%]$

Vo_req=Desired (trimmed) output voltage [V]
Output voltage Vo=12.007 V

Remote Sense

This module has remote sense compensation feature. It can minimize the effects of resistance between module's output and load in system layout and facilitates accurate voltage regulation at load terminals or other selected point.

1. The remote sense lines carries very little current and hence do not require a large cross-sectional area.
2. This module compensates for a maximum drop of 10% of the nominal output voltage.
3. If the unit is already trimmed up, the available remote sense compensation range should be correspondingly reduced. The total voltage increased by trim and remote sense should not exceed 10% of the nominal output voltage.
4. When using remote sense compensation, all the resistance, parasitic inductance and capacitance of the system are incorporated within the feedback loop of this module. It can make an effect on the module's compensation, affecting the stability and dynamic response. A 0.1uF ceramic capacitor can be connected at the point of load to de-couple noise on the sense wires.
5. Recommend the connection of remote sense compensation as below figure. There are a resistor RS+ (100 ohm) from Vo+ to Sense+ and a resistor RS- (51 ohm)) from Vo- to Sense- inside of this module.

6. If not using remote sense compensation, please connect sense directly to output at module's pin, that is, connect sense+ to Vo+ and sense- to Vo- at module's pin, the shorter the better. See below figure.

Over Current Protection

To provide protection in a fault output overload condition, the module is equipped with internal current-limiting circuitry and can endure current limiting for a few mili-seconds. If the over current condition persists beyond a few milliseconds, the module will shut down into hiccup mode and restart once every 400mS. The module operates normally when the output current goes into specified range. The typical average output current is 0.5A during hiccup.
