MAXIM

Low-Cost, SOT23, Voltage-Output, High-Side Current-Sense Amplifier

MAX4173T/F/H

General Description

The MAX4173 low-cost, precision, high-side current-sense amplifier is available in a tiny SOT23-6 package. It features a voltage output that eliminates the need for gain-setting resistors and it is ideal for today's notebook computers, cell phones, and other systems where current monitoring is critical. High-side current monitoring is especially useful in battery-powered systems, since it does not interfere with the ground path of the battery charger. The input common-mode range of 0 to +28V is independent of the supply voltage and ensures that the current-sense feedback remains viable even when connected to a battery in deep discharge. The MAX4173's wide 1.7MHz bandwidth makes it suitable for use inside battery charger control loops.

The combination of three gain versions and a user-selectable external sense resistor sets the full-scale current reading. This feature offers a high level of integration, resulting in a simple and compact current-sense solution.

The MAX4173 operates from a single +3V to +28V supply, typically draws only 420µA of supply current over the extended operating temperature range (-40°C to +85°C), and is offered in the space-saving SOT23-6 package.

Applications

Notebook Computers

Portable/Battery-Powered Systems

Smart Battery Packs/Chargers

Cell Phones

Power-Management Systems

General System/Board-Level Current Monitoring

PA Bias Control

Precision Current Sources

Features

♦ **Low-Cost, Compact Current-Sense Solution**

♦ **Wide 0 to +28V Common-Mode Range Independent of Supply Voltage**

♦ **Three Gain Versions Available**
   +20V/V (MAX4173T)
   +50V/V (MAX4173F)
   +100V/V (MAX4173H)

♦ **±0.5% Full-Scale Accuracy**

♦ **±0.3mV Input Offset Voltage (MAX4173T)**

♦ **420µA Supply Current**

♦ **Wide 1.7MHz Bandwidth (MAX4173T)**

♦ **+3V to +28V Operating Supply**

♦ **Available in Space-Saving SOT23-6 Package**

Pin Description

PIN		NAME	FUNCTION
SOT23-6	SO		
1, 2	3	GND	Ground
3	1	V_{CC}	Supply Voltage Input. Bypass to GND with a 0.1µF capacitor.
4	8	RS+	Power-Side Connection to the External Sense Resistor
5	6	RS-	Load-Side Connection for the External Sense Resistor
6	4	OUT	Voltage Output. V_{OUT} is proportional to V_{SENSE} (V_{RS+} - V_{RS-}). Output impedance is approximately 12kΩ.
–	2, 5, 7	N.C.	No Connection. Not internally connected.

MAXIM

Low-Cost, SOT23, Voltage-Output, High-Side Current-Sense Amplifier

Detailed Description

The MAX4173 high-side current-sense amplifier features a 0 to +28V input common-mode range that is independent of supply voltage. This feature allows the monitoring of current out of a battery in deep discharge and also enables high-side current sensing at voltages greater than the supply voltage (V_{CC}).

The MAX4173 operates as follows: Current from the source flows through R_{SENSE} to the load (Figure 1). Since the internal-sense amplifier's inverting input has high impedance, negligible current flows through RG2 (neglecting the input bias current). Therefore, the sense amplifier's inverting-input voltage equals $V_{SOURCE} - (I_{LOAD})(R_{SENSE})$. The amplifier's open-loop gain forces its noninverting input to the same voltage as the inverting input. Therefore, the drop across RG1 equals $(I_{LOAD})(R_{SENSE})$. Since I_{RG1} flows through RG1, $I_{RG1} = (I_{LOAD})(R_{SENSE}) / RG1$. The internal current mirror multiplies I_{RG1} by a current gain factor, β, to give $I_{RGD} = \beta \cdot I_{RG1}$. Solving $I_{RGD} = \beta \cdot (I_{LOAD})(R_{SENSE}) / RG1$. Assuming infinite output impedance, $V_{OUT} = (I_{RGD})(RGD)$. Substituting in for I_{RGD} and rearranging, $V_{OUT} = \beta \cdot (RGD / RG1)(R_{SENSE} \cdot I_{LOAD})$. The parts gain equals $\beta \cdot RGD / RG1$. Therefore, $V_{OUT} = (GAIN) (R_{SENSE})(I_{LOAD})$, where GAIN = 20 for MAX4173T, GAIN = 50 for MAX4173F, and GAIN = 100 for MAX4173H.

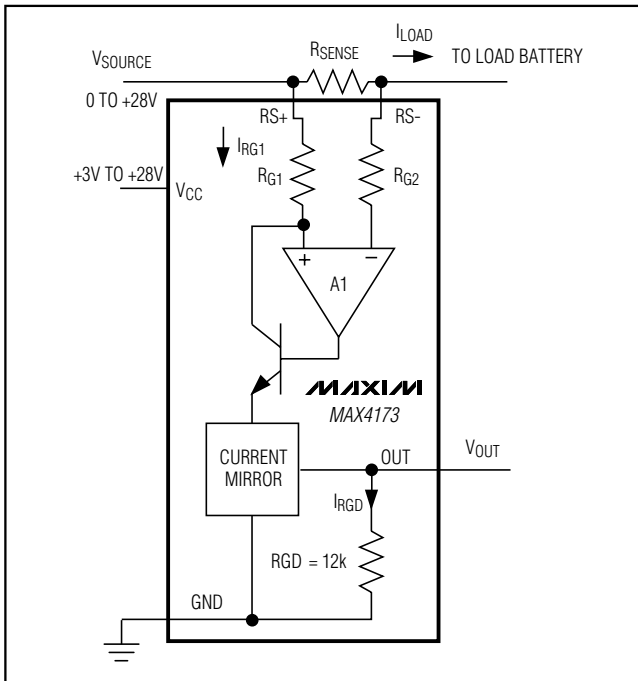

Figure 1. Functional Diagram

Set the full-scale output range by selecting R_{SENSE} and the appropriate gain version of the MAX4173.

Applications Information

Recommended Component Values

The MAX4173 senses a wide variety of currents with different sense resistor values. Table 1 lists common resistor values for typical operation of the MAX4173.

Choosing R_{SENSE}

To measure lower currents more accurately, use a high value for R_{SENSE}. The high value develops a higher sense voltage that reduces offset voltage errors of the internal op amp.

In applications monitoring very high currents, R_{SENSE} must be able to dissipate the I^2R losses. If the resistor's rated power dissipation is exceeded, its value may drift or it may fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings.

If I_{SENSE} has a large high-frequency component, minimize the inductance of R_{SENSE}. Wire-wound resistors have the highest inductance, metal-film resistors are somewhat better, and low-inductance metal-film resistors are best suited for these applications.

Using a PCB Trace as R_{SENSE}

If the cost of R_{SENSE} is an issue and accuracy is not critical, use the alternative solution shown in Figure 2. This solution uses copper PC board traces to create a sense resistor. The resistivity of a 0.1-inch-wide trace of 2-ounce copper is approximately 30mΩ/ft. The resistance-temperature coefficient of copper is fairly high (approximately 0.4%/°C), so systems that experience a wide temperature variance must compensate for this effect. In addition, do not exceed the maximum power dissipation of the copper trace.

For example, the MAX4173T (with a maximum load current of 10A and an R_{SENSE} of 5mΩ) creates a full-scale V_{SENSE} of 50mV that yields a maximum V_{OUT} of 1V. R_{SENSE} in this case requires about 2 inches of 0.1 inch-wide copper trace.

Output Impedance

The output of the MAX4173 is a current source driving a 12kΩ resistance. Resistive loading added to OUT reduces the output gain of the MAX4173. To minimize output errors for most applications, connect OUT to a high-impedance input stage. When output buffering is required, choose an op amp with a common-mode input range and an output voltage swing that includes ground when operating with a single supply. The op

Figure 3. Current Source

amp's supply voltage range should be at least as high as any voltage the system may encounter.

The percent error introduced by output loading is determined with the following formula:

$$\%_{ERROR} = 100 \left(\frac{R_{LOAD}}{12k\Omega + R_{LOAD}} - 1 \right)$$

where R_{LOAD} is the external load applied to OUT.

Current Source Circuit

Figure 3 shows a block diagram using the MAX4173 with a switching regulator to make a current source.
