v00.1112

HMC6001LP711E

MILLIMETERWAVE RECEIVER 57 - 64 GHz

Typical Applications

The HMC6001LP711E is ideal for:

- WiGig Single Carrier Modulations
- 60 GHz ISM Band Data Transmitter
- Multi-Gbps Data Communications
- High Definition Video Transmission
- RFID

General Description

The HMC6001LP711E is a complete mmWave receiver IC and low profile antenna integrated in a plastic surface mount package. The receiver includes an LNA, image reject filter, RF to IF downconverter, IF filter, I/Q downconverter, and frequency synthesizer. The receiver operates from 57 to 64 GHz with 1.8 GHz modulation bandwidth. An integrated synthesizer provides tuning in 500 or 540 MHz step sizes depending on the choice of external reference clock. Support for a wide variety of modulation formats is provided through a universal analog baseband IQ interface. Together with the HMC6000LP711E, a complete transmit/receive chipset is provided for multi-Gbps operation in the unlicensed 60 GHz ISM band.

Features

Support for IEEE Channel Plan

Receiver Gain: 2 - 67 dB

Noise Figure: 7.0 dB

Integrated Low Profile Antenna: 7.5 dBi

Integrated Image Reject Filter

Integrated Frequency Synthesizer

Programmable IF and Baseband Gain Blocks

Universal Analog I/Q Baseband Interface

Integrated AM and FM Demodulator

Three-Wire Serial Digital Interface

60 Lead 7x11 mm SMT Package: $77mm^2$

Functional Diagram

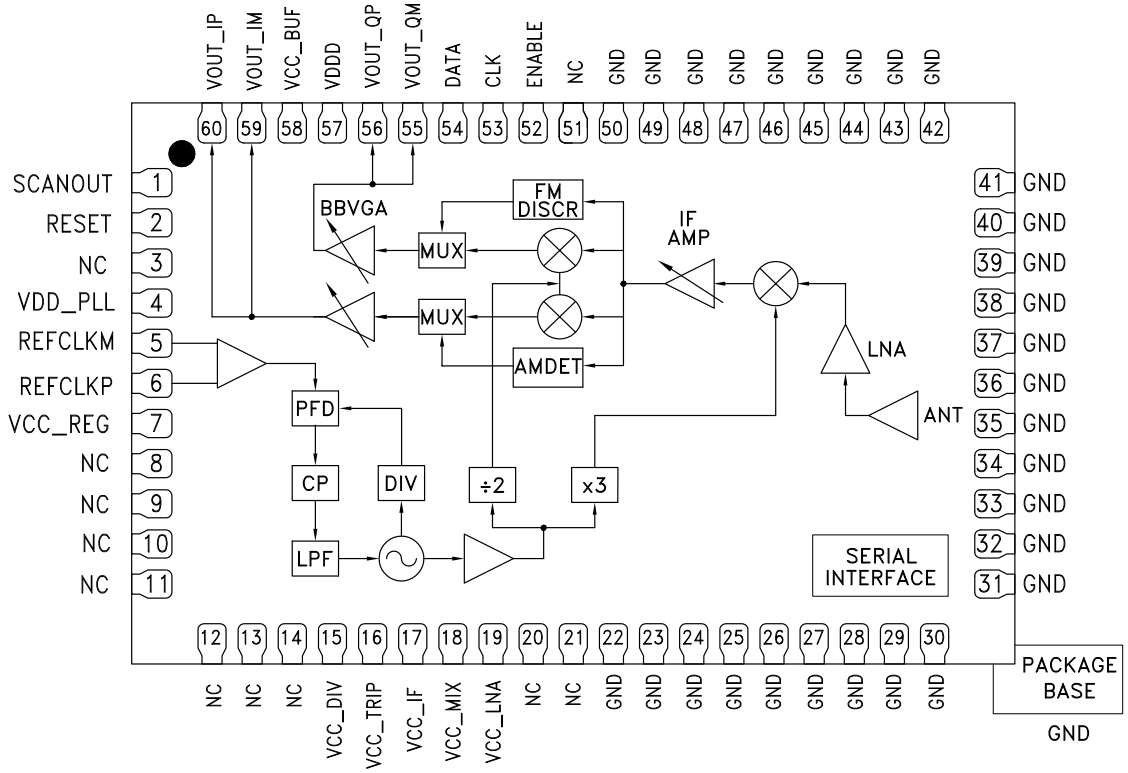

Table 1. Electrical Specifications, TA = +25° C, See Test Conditions

Parameter	Condition	Min.	Typ.	Max.	Units
Frequency Range		57		64	GHz
Frequency Step Size	308.5714 MHz Ref Clk		0.54		GHz
Frequency Step Size	285.714 MHz Ref Clk		0.50		GHz
Modulation Bandwidth	Max BW setting, 5dB BW, double-sided		1.8		GHz
Max Gain	Total Pout at all 4 baseband outputs minus Pin at the IC [1]		67		dB
Gain Control Range			65		dB
Gain Step Size			1		dB

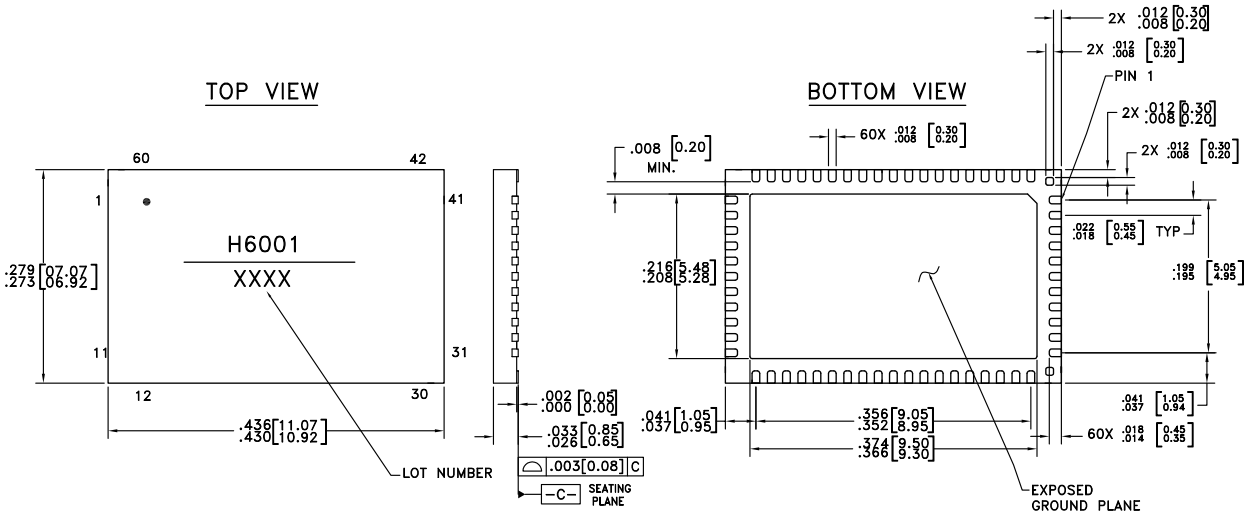
Table 5. Absolute Maximum Ratings

Input Power to IC	0 dBm
VDD = 2.7 V	2.85 Vdc
VCC = 2.7 V	2.85 Vdc
VDD_PLL = 1.35 V	1.6 Vdc
VDDD = 1.35 V	1.6 Vdc
GND	0± 50 mV
Serial Digital Interface Input Voltage	1.5 Vdc
Ref CLK Input (AC coupled)(each)	0.75 Vp-p
Baseband Outputs (BB, FM)	0.75 Vp-p
Junction Temperature	125°C
Continuous Pdiss (T=85°C) (derate 45 mW/°C above 85°C)	0.760 W
Thermal Resistance (Rth) (Junction to ground paddle)	22.16 °C/W
Storage Temperature	-55°C to 150°C
Operating Temperature	-40°C to 85°C
ESD Sensitivity (HBM)	Class 1A

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Outline Drawing



NOTES:
1. ALL DIMENSIONS ARE IN INCHES [MM]
2. LEAD SPACING TOLERANCE IS NON-CUMULATIVE.
3. PAD BURR LENGHT SHALL BE 0.15 mm MAX. PAD BURR HEIGHT SHALL BE 0.05 mm MAX.
4. PACKAGE WARP SHALL NOT EXCEED 0.05 mm
5. ALL GROUND LEADS AND GROUND PADDLE MUST BE SOLDERED TO PCB RF GROUND
6. REFER TO HITTITE APPLICATION NOTE FOR SUGGESTED PCB LAND PATTERN.

Table 6. Package Information

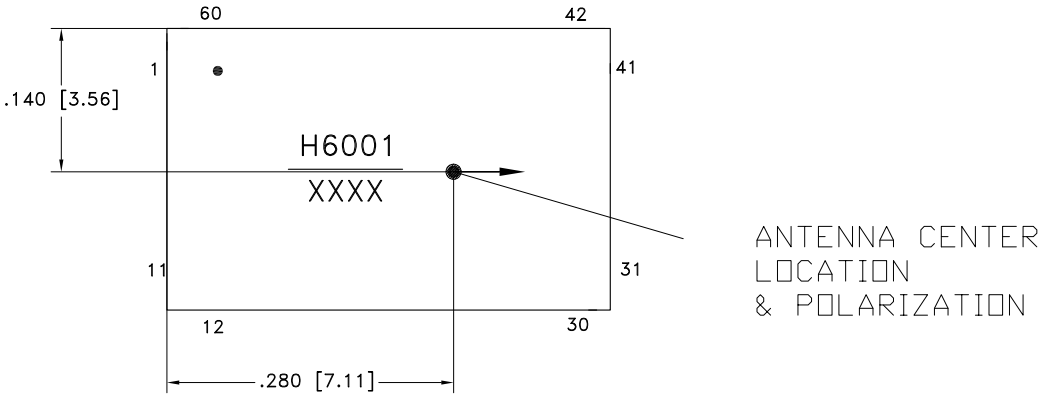
Part Number	Package Body Material	Lead Finish	MSL Rating	Package Marking
HMC6001LP711E	RoHS-compliant Low Stress Injection Molded Plastic Silica and Silicon	100% matte Sn	MSL3	H6001 XXXX

[1] 4-Digit lot number XXXX

Table 7. Pin Descriptions

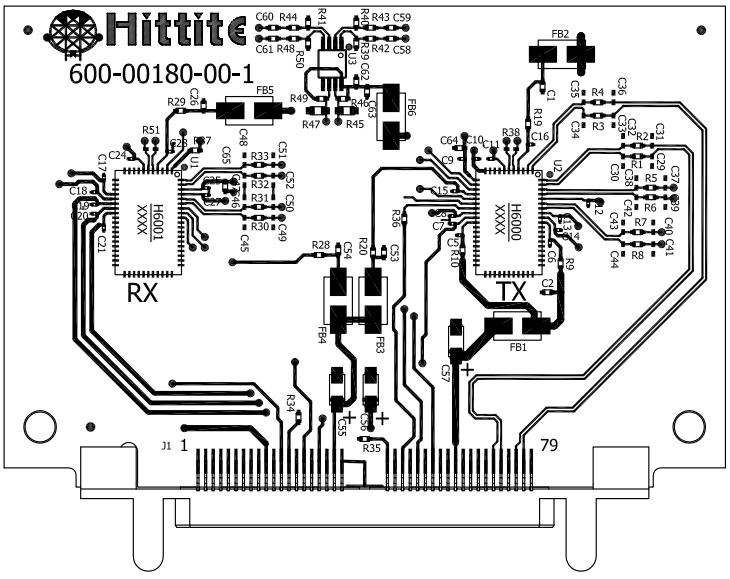
Pin Number	Function	Description
1	SCANOUT	Serial digital interface out (1.2V CMOS) - 50kΩ
2	RESET	Asynchronous reset-all registers (1.2V CMOS, active high) - 50kΩ
3, 8-14, 20, 21, 51	NC	These pins are not connected internally
4	VDD_PLL	1.35 supply (VCO)
5	REFCLKM	Xtal REF CLK Minus - AC or DC coupled - 50Ω
6	REFCLKP	Xtal REF CLK Minus - AC or DC coupled - 50Ω
7	VCC_REG	2.7V supply (VCO)
15	VCC_DIV	2.7V supply (Divider)
16	VCC_TRIP	2.7V supply (Tripler)
17	VCC_IF	2.7V supply (IF)
18	VCC_MIX	2.7V supply (Mixer)
19	VCC_LNA	2.7V supply (LNA)
22-50	GND	These pins and package bottom must be connected to RF/DC ground externally.
52	ENABLE	Serial digital interface enable (1.2V CMOS) - 50kΩ
53	CLK	Serial digital interface clock (1.2V CMOS) - 50kΩ
54	DATA	Serial digital interface data (1.2V CMOS) - 50kΩ
55	VOUT_QM	Baseband negative quadrature output – DC coupled - 50Ω (1.3V c.m.)
56	VOUT_QP	Baseband positive quadrature output – DC coupled - 50Ω (1.3V c.m.)
57	VDDD	1.35 supply (serial data interface)
58	VCC_BUF	2.7V supply (BB VGA and output buffers)
59	VOUT_IM	Baseband negative in-phase output – DC coupled - 50Ω (1.3V c.m.)
60	VOUT_IP	Baseband positive in-phase output – DC coupled - 50Ω (1.3V c.m.)

Antenna-in-Package Location and Polarization



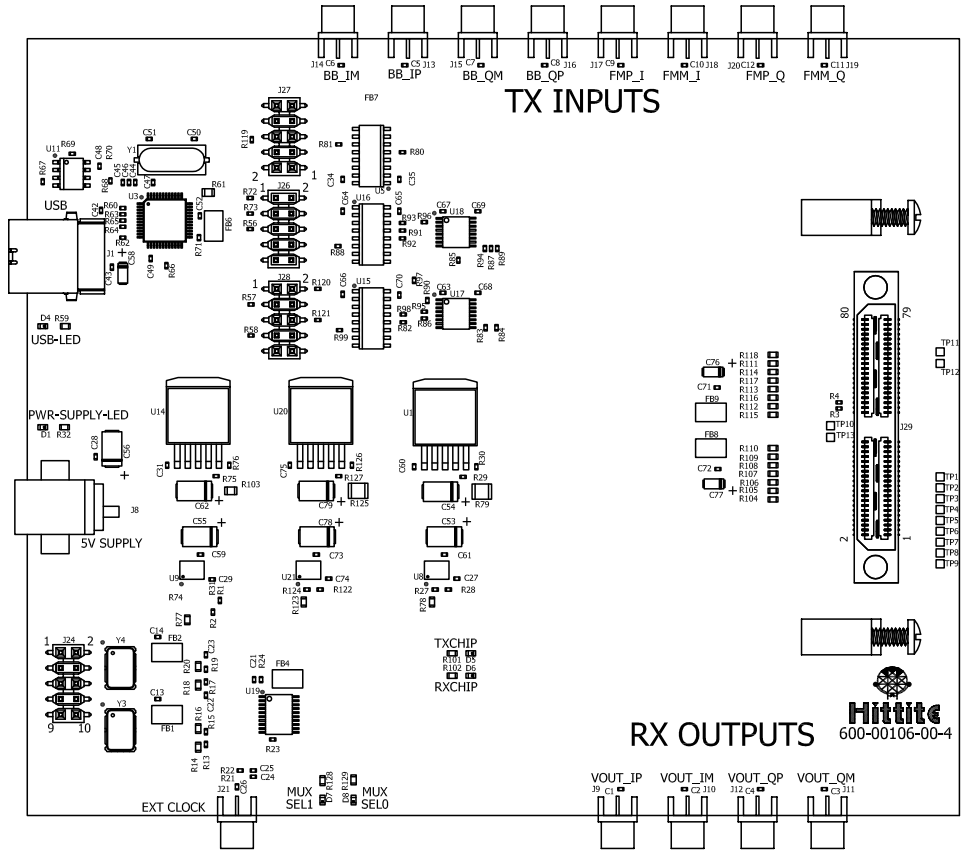
The antenna is located inside the package with geometric center and linear polarization angle as shown. The geometric center can be used as the antenna pattern phase center provided there is sufficient unobstructed ground plane extension around the chip. Measured antenna pattern phase centers will vary with frequecy and are dependent on finite ground plane effects, and coupling to nearby components.

Evaluation PCB Daughtercard



The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is part of an evaluation kit available from Hittite.

Evaluation PCB Motherboard



Evaluation PCB Schematics

To view the Evaluation PCB Schematics please visit www.hittite.com and choose HMC6001LP711E from the "Search by Part Number" pull down menu to view the product splash page.

Evaluation Kit

The HMC6450 evaluation kit contains everything that is needed to set up a bi-directional 60 GHz millimeter-wave link using standard RF cable interfaces for baseband input and output. Kit comes with two motherboard PCBs that provide on board crystals, USB interface, supply regulators, and SMA cables for connectorized IQ interfaces. Supplied software allows the user to read from and write to all chip level registers using a Graphical User Interface (GUI) or upload previously saved register settings.

Theory of Operation

An integrated frequency synthesizer creates a low-phase noise LO between 16.3 and 18.3 GHz. The step size of the synthesizer equates to 540MHz steps at RF when used with 308.5714 MHz reference crystal (compatible with the IEEE channels of the ISM band) or 500 MHz steps if used with a 285.714 MHz reference crystal.

A 57 to 64 GHz signal is received by an integrated low profile antenna which is connected to the single-ended LNA on the IC. The LO is multiplied by three and mixed with the LNA output to downconvert to an 8 to 9.1 GHz sliding IF. An integrated notch filter removes the image frequency. The IF signal is filtered and amplified with 17 dB of variable gain. If the chip is configured for IQ baseband output, the IF signal is fed into a quadrature demodulator using the LO/2 to downconvert to baseband. There are also options to use on-chip demodulators capabable of to demodulating AM/FM/FSK/MSK waveforms. Contact Hittite application support for further guidance and application notes if interested in these modes.

The phase noise and quadrature balance of the HMC6001LP711E is sufficient to demodulate up to 16QAM modulation for high data rate operation.

There are no special power sequencing requirements for the HMC6001LP711E; all voltages are to be applied simultaneously.

Register Array Assignments and Serial Interface

The register arrays for both the receiver and transmitter are organized into 16 rows of 8 bits. Using the serial interface, the arrays are written or read one row at a time as shown in Figure 25 and Figure 26, respectively. Figure 25 shows the sequence of signals on the ENABLE, CLK, and DATA lines to write one 8-bit row of the register array. The ENABLE line goes low, the first of 18 data bits (bit 0) is placed on the DATA line, and 2 ns or more after the DATA line stabilizes, the CLK line goes high to clock in data bit 0. The DATA line should remain stable for at least 2 ns after the rising edge of CLK.

The Rx IC will support a serial interface running up to several hundred MHz, and the interface is 1.2V CMOS levels. A write operation requires 18 data bits and 18 clock pulses, as shown in Figure 26. The 18 data bits contain the 8-bit register array row data (LSB is clocked in first), followed by the register array row address (ROW0 through ROW15, 000000 to 001111, LSB first), the Read/Write bit (set to 1 to write), and finally the Rx chip address 111, LSB first).

Note that the register array row address is 6 bits, but only four are used to designate 16 rows, the two MSBs are 0.

After the 18th clock pulse of the write operation, the ENABLE line returns high to load the register array on the IC; prior to the rising edge of the ENABLE line, no data is written to the array. The CLK line should have stabilized in the low state at least 2 ns prior to the rising edge of the ENABLE line.

61.56	00001	101
62.10	00010	101
62.64 (IEEE CH 3)	00011	110
63.18	00100	110
63.72	00101	111

Divide Ratio settings consist of registers ROW10 bit <0> (MSB) and ROW11 bits <4:7> (4 LSBs)

Table 10. 500 MHz Channels Using 285.7143 MHz Reference

Frequency (GHz)	Divider Setting	Typical Band Setting
57	00001	000
57.5	00010	000
58	00011	001
58.5	00100	001
59	00101	010
59.5	00110	010
60	00111	011
60.5	01000	011
61	01001	100
61.5	01010	100
62	01011	101
62.5	01100	101
63	01101	110
63.5	01110	110
64	01111	111

Divide Ratio settings consist of registers ROW10 bit <0> (MSB) and ROW11 bits <4:7> (4 LSBs)
