

LC587008, 587006, 587004

Single-Chip 4-Bit Microprocessors with LCD Driver, 2 Kb RAM, and 8, 12, or 16 KB ROM on chip

Preliminary

Overview

The LC587004, LC587006 and LC587008 are 80-pin low-voltage CMOS 4-bit microprocessors that include LCD drivers, 2 Kb RAM and 8, 12, or 16 KB ROM on chip. These microprocessors correspond to the earlier LC5870 series with the 256 by 4-bit on-chip RAM expanded to a 512 by 4-bit capacity.

Applications

- System control and LCD display in CD players, cameras and radio tuners
- System control and LCD display in miniature test equipment and consumer health care products
- These microprocessors are optimal for products that include LCD displays and, in particular, battery operated products.
- Remote controllers for VCRs and audio equipment

Functions

- Program ROM: 8064 × 16 bits (LC587008), 6144 × 16 bits (LC587006) and 4096 × 16 bits (LC587004)
- RAM: 512 × 4 bits on chip
- All instructions execute in a single cycle
- Cycle time and operating voltage ranges
 - 2 μs cycle time: $V_{DD} = 2.8$ to 6.0 V
 - 10 μs cycle time: $V_{DD} = 2.2$ to 6.0 V
 - 122 μs cycle time: $V_{DD} = 2.0$ to 6.0 V
- Rich set of HALT/HOLD mode clearing and interrupt functions
 - Eight HALT mode clearing functions
 - Seven HOLD mode clearing functions
 - Seven interrupt functions (all of which can be used as external interrupts)
 - Subroutines can be nested up to eight levels (including interrupt handling)
 - Built-in watchdog timer function

- Powerful hardware for improved processing capacity
 - Built-in segment PLA and segment decoder: LCD panel segments can be handled with no software processing of the LCD driver outputs. Also, the LCD drive pins can be switched to function as output ports.
 - Built-in 8-bit synchronous serial I/O circuit
 - One 8-bit programmable timer (that can be used as an event counter)
 - One 8-bit programmable reload timer (that can be used to generate a remote control carrier signal)
 - The whole RAM area can be used as working area (by using the RAM bank register)
 - Built-in RAM data pointer
 - Built-in clock oscillator and 15-bit divider (also used to generate the LCD alternating frequency)
- Highly flexible LCD panel drive output pins (35 pins)

LCD panel	Number of	Required
drive type	segments	common pins
1/3 bias 1/4 duty	140 segments	Four pins
1/3 bias 1/3 duty	105 segments	Three pins
1/2 bias 1/4 duty	140 segments	Four pins
1/2 bias 1/3 duty	105 segments	Three pins
1/2 bias 1/2 duty	70 segments	Two pins
Static	35 segments	One pin

The LCD output pins can be switched to function as general-purpose outputs.

 - C-MOS type: Up to 35 pins
 - P-channel type: Up to 35 pins
 - N-channel type: Up to 35 pins
- These microprocessors allow the use of an oscillator appropriate to the application system specifications.
 - Crystal oscillator: 32 kHz, 65 kHz or 38 kHz (for the time base, system clock or LCD alternating frequency)
 - Ceramic oscillator: 400 kHz to 4 Mhz (for the system clock and the timers and serial counter)
 - RC oscillator: 200 kHz to 1 MHz (for the system clock and the timers and serial counter)
 - External clock (for the system clock and the timers and serial counter)

Features

- These microprocessors are the top end of the LC5870 series and have the following features.
 - Faster cycle times
 - Cycle time: 2 μ s for V_{DD} between 4.5 and 6.0 V
 - Cycle time: 10 μ s for V_{DD} between 2.2 and 6.0 V
 - Low power dissipation HALT mode (typical)
 - Continuous operation (typical)
 - Ceramic filter (CF) 4 MHz (5.0 V) 600 μ A 1.7 mA (cycle time = 2 μ s)
 - Crystal oscillator 32 kHz (3.0 V, CF stopped) 4.0 μ A 20 μ A (cycle time = 122 μ s)
 - Improved timer functions
 - One 8-bit programmable timer (that can be used as an event counter)
 - One 8-bit programmable reload timer (that can be used to generate a remote control carrier signal)
 - Time base timer (for use as a clock)
 - Watchdog timer
 - Improved standby functions
 - Clock standby function (HALT mode), software switching between low speed mode (low current) and high speed mode
 - Full standby mode (HOLD mode)
 - HALT and HOLD modes can be cleared by external interrupt pins, input ports (up to nine pins) and serial I/O interrupts
 - Improved I/O functions
 - External interrupt pins
 - Up to 9 input and I/O pins that can clear HALT and HOLD modes
 - Up to 24 input ports with built-in software controllable input resistors (either pull-up or pull-down specified as mask options)
 - Up to 25 input port pins with a built-in floating prevention circuit
 - LCD driver: four common pins and 35 segment pins
 - General-purpose I/O ports: 20 pins (of which 12 are p-channel open drain and 4 are n-channel open drain)
 - General-purpose inputs: five pins
 - General-purpose outputs (type 1): four pins (LED direct drive pins, one internal alarm signal output pin and one carrier output pin)
 - General-purpose outputs (type 2): 35 pins (when all 35 LCD segment port pins are switched over to function as general-purpose outputs)
 - Eight-bit serial I/O port: one set (three pins: input, output and clock)
- Delivery formats: QFP80 (QIP80) and chip

Package Dimensions

unit: mm

3044B-QFP80A

One of these mask options must be specified.</p>

K Input Port Options

Option	Circuit configuration	Note
<p>Pull-up/pull-down resistor selection</p>		<p>When the pull-up/pull-down resistor selection is made, the K port input detection switching gate is switched accordingly.</p> <p>A: When all of K1 to K4 are high and even one pin goes low a signal is applied to the edge detection circuit. (Applies to the pull-up specifications.)</p> <p>Note: When even one of the K1 to K4 pins is low, the edge detection circuit will not operate for any combination of high or low values on the other pins.</p> <p>B: The opposite of item A</p>

Mask Option Overview

1. Port resistor selection (ports S, K, P, M, A and SO)
 - Pull-up resistor specification
 - Pull-down resistor specification
2. S port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
3. K port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
4. M port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
5. P port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
6. A port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
7. SO port high or low level hold transistors
 - Level hold transistors used
 - No level hold transistors
8. INT pin resistor selection and signal edge selection
 - Pull-up resistor (negative edge)
 - Pull-down resistor (positive edge)
 - Open (negative edge)
 - Open (positive edge)
9. INT pin level hold transistor selection
 - Low or high level hold transistors used
 - No low or high level hold transistors
10. RES pin
 - Pull-up resistor (low level reset)
 - Pull-down resistor (high level reset)
 - Open (low level reset)
 - Open (high level reset)
11. N1 pin
 - N-channel open drain type
 - CMOS type
12. N2 pin
 - N-channel open drain type
 - CMOS type
13. N3 pin
 - N-channel open drain type
 - CMOS type

14. N4 pin
 - N-channel open drain type
 - CMOS type
15. N port initial level
 - High level
 - Low level
16. OSC specifications
 - CF only (ceramic filter)
 - RC only (resistor and capacitor oscillator)
 - Crystal only (32 to 65 kHz crystal oscillator)
 - CF + crystal
 - RC + crystal
 - External + crystal
17. CF/External
 - 400 kHz or 800 kHz
 - 1 MHz, 2 MHz or 4 MHz
18. Crystal oscillator
 - 32 kHz
 - 65 kHz
 - 38 kHz
19. Fifteen-bit counter overflow
 - $\emptyset 0/2048$ or $\emptyset 8192$
 - $\emptyset 0/4096$ or $\emptyset 16384$
20. Serial I/O internal clock period
 - Cycle time $\times 1 \times 2$
 - Cycle time $\times 2 \times 2$
 - Cycle time $\times 4 \times 2$
21. LCD driver
 - Static
 - 1/2 bias – 1/2 duty
 - 1/2 bias – 1/3 duty
 - 1/2 bias – 1/4 duty
 - 1/3 bias – 1/3 duty
 - 1/3 bias – 1/4 duty
22. LCD alternating frequency
 - Slow
 - Typical
 - Fast
23. Internal reset circuit
 - Selection
 - Disabled
24. Segment ports at reset
 - LCD drive pins
 - All on
 - All off
 - CMOS, p/n-channel type pins
 - High level

Internal Register Functions

Symbol	R/W	Function	Initialization value at reset																																																																																																																																												
PC	—	<p>Program counter</p> <p>The PC is a 13-bit counter that indicates the address in program memory (ROM) of the next instruction to execute. Normally the PC is incremented on every instruction cycle in the range 000H to 1F7FH. (Addresses in the range 1F80 to 1FFF are reserved for testing and cannot be used by user programs.) However, data values are loaded into the PC by the execution of branch and subroutine instructions and on the occurrence of interrupts or an initial reset. The table below describes the data loaded for these operations.</p> <table border="1"> <thead> <tr> <th>Operation \ PC</th> <th>PC12</th> <th>PC11</th> <th>PC10</th> <th>PC9</th> <th>PC8</th> <th>PC7</th> <th>PC6</th> <th>PC5</th> <th>PC4</th> <th>PC3</th> <th>PC2</th> <th>PC1</th> <th>PC0</th> </tr> </thead> <tbody> <tr> <td>Initializing reset</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>INT pin external interrupt</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>1</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>S/K pin external interrupt</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>1</td> <td>0</td> <td>1</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Timer 1 or timer 2 internal interrupt</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>1</td> <td>1</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Serial counter internal interrupt or SO4 pin external interrupt</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>0</td> <td>1</td> <td>1</td> <td>1</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>Unconditional jump (JMP)</td> <td>Page</td> <td>P10</td> <td>P9</td> <td>P8</td> <td>P7</td> <td>P6</td> <td>P5</td> <td>P4</td> <td>P3</td> <td>P2</td> <td>P1</td> <td>P0</td> <td></td> </tr> <tr> <td>Conditional jump (BAB0, BAB1, BAB2, BAB3, BAZ, BANZ, BCH, BCNH)</td> <td>Page</td> <td>P10</td> <td>P9</td> <td>P8</td> <td>P7</td> <td>P6</td> <td>P5</td> <td>P4</td> <td>P3</td> <td>P2</td> <td>P1</td> <td>P0</td> <td></td> </tr> <tr> <td>Call instruction (CALL)</td> <td>Page</td> <td>P10</td> <td>P9</td> <td>P8</td> <td>P7</td> <td>P6</td> <td>P5</td> <td>P4</td> <td>P3</td> <td>P2</td> <td>P1</td> <td>P0</td> <td></td> </tr> <tr> <td>Return instruction (RTS, RTSR)</td> <td colspan="13">CALL address + 1</td> </tr> </tbody> </table> <p>Page: the ROM page flags, which take 2048 locations as a single page The page is specified with the MROPF and SROPF instructions. Specifications

The electrical characteristics specified here are provisional and subject to change.

Absolute Maximum Ratings at $V_{SS} = 0\text{ V}$, $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	min	typ	max	Unit	
Maximum supply voltage	V_{DD}		-0.3		+7.0	V	
	V_{DD1}		-0.3		V_{DD}	V	
	V_{DD2}		-0.3		V_{DD}	V	
Maximum input voltage	V_I (1)	Allowed in the specified circuit (Figure 1), XTIN, CFIN	Allowed up to the generated voltage				
	V_I (2)	S1 to S4, K1 to K4, P1 to P4, SO1 to SO4, A1 to A4, RES, INT, TST, (With the K, P, M, SO and ports in input mode)	-0.3		$V_{DD} + 0.3$	V	
Maximum output voltage	V_O (1)	Allowed in the specified circuit (Figure 1), XTOUT, CFOUT	Allowed up to the generated voltage				
	V_O (2)	K1 to K4, P1 to P4, SO1 to SO4, A1 to A4, N1 to N4, CUP1, CUP2, Seg1 to Seg35, COM1 to COM4 (With the K, P, M, SO and A ports in output mode)	-0.3		$V_{DD} + 0.3$	V	
	V_O (3)	Open drain specifications, N1 to N4 (N ch)	-0.3		+13	V	
Output pin current	I_O (1)	Per pin	N1 to N4	0		+15	mA
	I_O (2)			-10		0	mA
	I_O (3)	Per pin	K1 to K4, P1 to P4, M1 to M4, SO1 to SO4, A1 to A4	0		5	mA
	I_O (4)			-5		0	mA
	ΣI_O (1)	Total current	K1 to K4, P1 to P4, M1 to M4, SO1 to SO4, A1 to A4, N1 to N4, Seg1 to Seg35			70	mA
	ΣI_O (2)	for all pins		-70			mA
Allowable power dissipation	P_d max	QIP80 flat package			500	mW	
Operating temperature	T_{opg}		-30		+70	$^\circ\text{C}$	
Storage temperature	T_{stg}		-55		+125	$^\circ\text{C}$	

Allowable Operating Ranges at $V_{SS} = 0\text{ V}$, $T_a = -30\text{ to }+70^\circ\text{C}$

Parameter	Symbol	Conditions	min	typ	max	Unit	
Supply voltage	V_{DD}	LCD unused specifications: $V_{DD1} = V_{DD2} = V_{DD}$	2.0		6.0	V	
		Static specifications: $V_{DD1} = V_{DD2} = V_{DD}$	2.0		6.0	V	
		1/2 bias specifications: $V_{DD1} = V_{DD2} \approx 2 \times 1/2 V_{DD}$	2.8		6.0	V	
		1/3 bias specifications: $V_{DD1} = 2 \times 1/3 V_{DD}$, $V_{DD2} = 1/3 V_{DD}$	2.8		6.0	V	
Hold supply voltage	V_{HD}	Voltage required to hold the contents of RAM and the registers*	2.0		V_{DD}	V	
Input high level voltage	V_{IH1}	S1 to S4, K1 to K4, P1 to P4, M1 to M4, SO1 to SO4, A1 to A4, INT, (With the K, P, M, SO and ports in input mode)	$0.7 V_{DD}$		V_{DD}	V	
Input low level voltage	V_{IL1}		0		$0.3 V_{DD}$	V	
Input high level voltage	V_{IH2}	RES pin	$0.75 V_{DD}$		V_{DD}	V	
Input low level voltage	V_{IL2}		0		$0.25 V_{DD}$	V	
Input high level voltage	V_{IH3}	CFIN pin	$0.75 V_{DD}$		V_{DD}	V	
Input low level voltage	V_{IL3}		0		$0.25 V_{DD}$	V

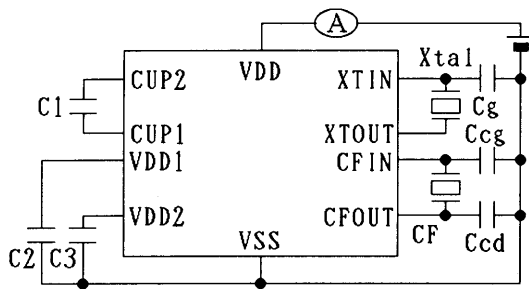

Figure 3 Supply Leakage Test Circuit

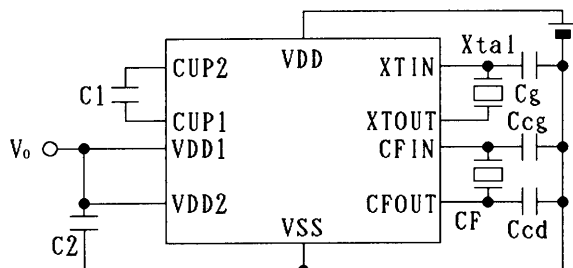

Figure 4 Output Voltage Test Circuit

- Stopped state
- S-port input resistors: on state
- I/O ports: output mode, all data values high
- RES and INT pins: built-in resistor specifications, open state
- Currents due to external components connected to the LCD ports are not included.
- Crystal frequency: between 32 and 65 kHz
- CF frequency: 200 kHz to 4 MHz
- Crystal frequency: 32 kHz
- C1, C2 and C3: 0.1 μF
- LCD ports: open
- CF frequency: 200 kHz to 4 MHz

Figures 4 and 5

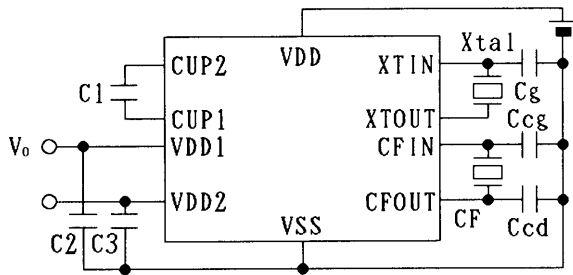

Figure 5 Output Voltage Test Circuit

Note: With the CF oscillator in the stopped state, with a 32, 38 or 65 kHz crystal. C1, C2 and C3 are 0.1 μ F.
