NEC

MOS INTEGRATED CIRCUIT

μPD4264405, 42S65405, 4265405

64 M-BIT DYNAMIC RAM
16 M-WORD BY 4-BIT, EDO

Description

The μPD4264405, 42S65405, 4265405 are 16,777,216 words by 4 bits CMOS dynamic RAMs with optional EDO.

EDO is a kind of the page mode and is useful for the read operation.

Besides, the μPD42S65405 can execute $\overline{CAS}$ before $\overline{RAS}$ self refresh.

These are packaged in 32-pin plastic TSOP (II) and 32-pin plastic SOJ.

Features

- EDO (Hyper page mode)
- 16,777,216 words by 4 bits organization
- Single +3.3 V ± 0.3 V power supply
- Fast access and cycle time

★

Part number	Power consumption Active (MAX.)	Access time (MAX.)	R/W cycle time (MIN.)	EDO (Hyper page mode) cycle time (MIN.)
μPD4264405-A50	360 mW	50 ns	84 ns	20 ns
μPD42S65405-A50, 4265405-A50	468 mW			
μPD4264405-A60	324 mW	60 ns	104 ns	25 ns
μPD42S65405-A60, 4265405-A60	396 mW			

★ • The μPD42S65405 can execute $\overline{CAS}$ before $\overline{RAS}$ self refresh.

Part number	Refrech cycle	Refresh	Power consumption at standby (MAX.)
μPD42S65405	4,096 cycles/128 ms	$\overline{RAS}$ only refresh, Normal read/write, $\overline{CAS}$ before $\overline{RAS}$ self refresh, $\overline{CAS}$ before $\overline{RAS}$ refresh, Hidden refresh	0.72 mW (CMOS level input)
μPD4264405	8,192 cycles/64 ms	$\overline{RAS}$ only refresh, Normal read/write	1.8 mW (CMOS level input)
	4,096 cycles/64 ms	$\overline{CAS}$ before $\overline{RAS}$ refresh, Hidden refresh	
μPD4265405	4,096 cycles/64 ms	$\overline{RAS}$ only refresh, Normal read/write, $\overline{CAS}$ before $\overline{RAS}$ refresh, Hidden refresh

Input/Output Pin Functions

The μPD4264405, 42S65405, 4265405 have input pins $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$, Address**Note** and input/output pins I/O1 to I/O4.

Pin name	Input/Output	Function
$\overline{RAS}$ (Row address strobe)	Input	$\overline{RAS}$ activates the sense amplifier by latching a row address and selecting a corresponding word line. It refreshes memory cell array of one line selected by the row address. It also selects the following function. • $\overline{CAS}$ before $\overline{RAS}$ self refresh, $\overline{CAS}$ before $\overline{RAS}$ refresh
$\overline{CAS}$ (Column address strobe)	Input	$\overline{CAS}$ activates data input/output circuit by latching column address and selecting a digit line connected with the sense amplifier.
A0 to A×**Note** (Address inputs)	Input	Address bus. Input total 24-bit of address signal, upper bits and lower bits**Note** in sequence (address multiplex method). Therefore, one word is selected from 16,777,216-word by 4-bit memory cell array. In actual operation, latch row address by specifying row address and activating $\overline{RAS}$. Then, switch the address bus to column address and activate $\overline{CAS}$. Each address is taken into the device when $\overline{RAS}$ and $\overline{CAS}$ are activated. Therefore, the address input setup time (t_{ASR}, t_{ASC}) and hold time (t_{RAH}, t_{CAH}) are specified for the activation of $\overline{RAS}$ and $\overline{CAS}$.
$\overline{WE}$ (Write enable)	Input	Write control signal. Write operation is executed by activating $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$.
$\overline{OE}$ (Output enable)	Input	Read control signal. Read operation can be executed by activating $\overline{RAS}$, $\overline{CAS}$ and $\overline{OE}$. If $\overline{WE}$ is activated during read operation, $\overline{OE}$ is to be ineffective in the device. Therefore, read operation cannot be executed.
I/O1 to I/O4 (Data inputs/outputs)	Input/Output	4-bit data bus. I/O1 to I/O4 are used to input/output data.

μPD42S65405, 4265405	A0 - A11	12	12

Hyper Page Mode (EDO)

The hyper page mode (EDO) is a kind of page mode with enhanced features. The two major features of the hyper page mode (EDO) are as follows.

1. **Data output time is extended.**

    In the hyper page mode (EDO), the output data is held to the next $\overline{CAS}$ cycle's falling edge, instead of the rising edge. For this reason, valid data output time in the hyper page mode (EDO) is extended compared with the fast page mode (= data extend function). In the fast page mode, the data output time becomes shorter as the $\overline{CAS}$ cycle time becomes shorter. Therefore, in the hyper page mode (EDO), the timing margin in read cycle is larger than that of the fast page mode even if the $\overline{CAS}$ cycle time becomes shorter.

2. **The $\overline{CAS}$ cycle time in the hyper page mode (EDO) is shorter than that in the fast page mode.**

    In the hyper page mode (EDO), due to the data extend function, the $\overline{CAS}$ cycle time can be shorter than in the fast page mode if the timing margin is the same.

    Taking a device whose t_{RAC} is 60 ns as an example, the $\overline{CAS}$ cycle time in the fast page mode is 25 ns while that in the fast page mode is 40 ns.

    In the hyper page mode (EDO) , read (data out) and write (data in) cycles can be executed repeatedly during one $\overline{RAS}$ cycle. The hyper page mode (EDO) allows both read and write operations during one cycle.

The following shows a part of the hyper page mode (EDO) read cycle. Specifications to be observed are described in the next page.

Hyper Page Mode (EDO) Read Cycle
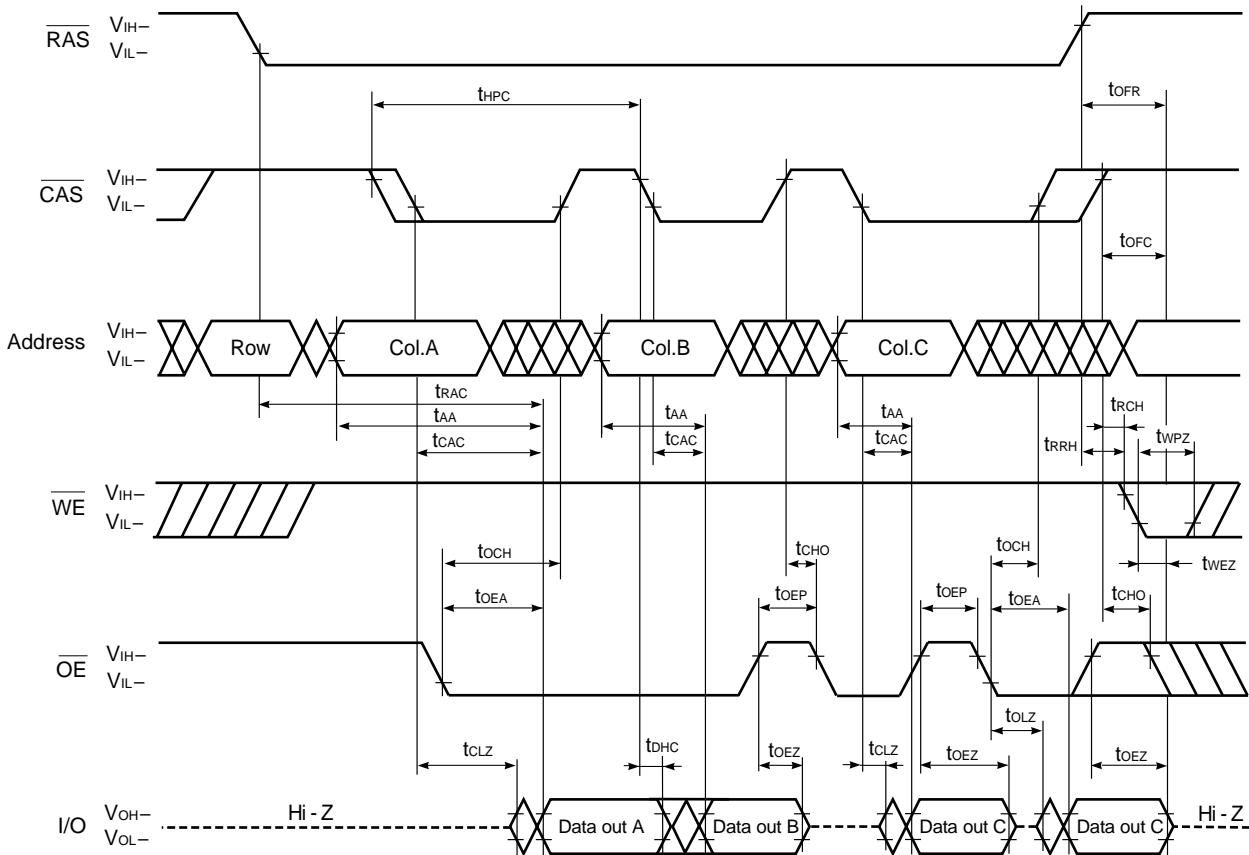

Cautions when using the hyper page mode (EDO)

1. $\overline{CAS}$ access should be used to operate t_{HPC} at the MIN. value.

2. To make I/Os to Hi-Z in read cycle, it is necessary to control $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$ as follows. The effective specification depends on the state of each signal.

    (1) Both $\overline{RAS}$ and $\overline{CAS}$ are inactive (at the end of read cycle)

      $\overline{WE}$: inactive, $\overline{OE}$: active

      t_{OFC} is effective when $\overline{RAS}$ is inactivated before $\overline{CAS}$ is inactivated.

      t_{OFR} is effective when $\overline{CAS}$ is inactivated before $\overline{RAS}$ is inactivated.

      The slower of t_{OFC} and t_{OFR} becomes effective.

    (2) Both $\overline{RAS}$ and $\overline{CAS}$ are active or either $\overline{RAS}$ or $\overline{CAS}$ is active (in read cycle)

      $\overline{WE}$, $\overline{OE}$: inactive ····· t_{OEZ} is effective.

      Both $\overline{RAS}$ and $\overline{CAS}$ are inactive or $\overline{RAS}$ is active and $\overline{CAS}$ is inactive (at the end of read cycle)

      $\overline{WE}$, $\overline{OE}$: active and either t_{RRH} or t_{RCH} must be met ····· t_{WEZ} and t_{WPZ} are effective.

      The faster of t_{OEZ} and t_{WEZ} becomes effective.

    The faster of (1) and (2) becomes effective.

3. In read cycle, the effective specification depends on the state of $\overline{CAS}$ signal when controlling data output with the $\overline{OE}$ signal.

    (1) $\overline{CAS}$: inactive, $\overline{OE}$: active ····· t_{CHO} is effective.

    (2) $\overline{CAS}$, $\overline{OE}$: active ····· t_{OCH} is effective.

Electrical Specifications

- All voltages are referenced to GND.
- After power up ($V_{CC} \geq V_{CC(MIN.)}$), wait more than 100 μs ($\overline{RAS}$, $\overline{CAS}$ inactive) and then, execute eight $\overline{CAS}$ before $\overline{RAS}$ or $\overline{RAS}$ only refresh cycles as dummy cycles to initialize internal circuit.

Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Voltage on any pin relative to GND	V_T		−0.5 to +4.6	V
Supply voltage	V_{CC}		−0.5 to +4.6	V
Output current	I_O		50	mA
Power dissipation	P_D		1	W
Operating ambient temperature	T_A		0 to +70	°C
Storage temperature	T_{stg}		−55 to +125	°C

Caution **Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.**

Recommended Operating Conditions

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply voltage	V_{CC}		3.0	3.3	3.6	V
High level input voltage	V_{IH}		2.0		V_{CC} + 0.3	V
Low level input voltage	V_{IL}		−0.3		+0.8	V
Operating ambient temperature	T_A		0		70	°C

Capacitance (T_A = 25 °C, f = 1 MHz)

Parameter	Symbol	Test condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{I1}	Address			5	pF
	C_{I2}	$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$			7	
Data input/output capacitance	$C_{I/O}$	I/O			7	pF

Low level output voltage		V_{OL}	$I_O = +2.0$ mA			0.4	V	

Notes 1. I_{CC1}, I_{CC3}, I_{CC4}, I_{CC5} and I_{CC6} depend on cycle rates (t_{RC} and t_{HPC}).

2. Specified values are obtained with outputs unloaded.

3. I_{CC1} and I_{CC3} are measured assuming that address can be changed once or less during $\overline{RAS} \leq V_{IL\,(MAX.)}$ and $\overline{CAS} \geq V_{IH\,(MIN.)}$.

4. I_{CC3} is measured assuming that all column address inputs are held at either high or low.

5. I_{CC4} is measured assuming that all column address inputs are switched only once during each hyper page (EDO) cycle.

$\overline{OE}$ to data delay time		t_{OED}	10	–	13	–	ns	
Transition time (rise and fall)		t_T	1	50	1	50	ns	
Refresh time	μPD42S65405	t_{REF}	–	128	–	128	ms	4
	μPD4264405, 4265405		–	64	–	64	ms	

Notes 1. In $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles, $t_{RAS(MAX)}$ is 100 μs.

If 10 μs < t_{RAS} < 100 μs, $\overline{\text{RAS}}$ precharge time for $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh (t_{RPS}) is applied.

2. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{\text{RAS}}$
$t_{RAD} \leq t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{RAC\ (MAX.)}$	$t_{RAC\ (MAX.)}$
$t_{RAD} > t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{AA\ (MAX.)}$	$t_{RAD} + t_{AA\ (MAX.)}$
$t_{RCD} > t_{RCD\ (MAX.)}$	$t_{CAC\ (MAX.)}$	$t_{RCD} + t_{CAC\ (MAX.)}$

$t_{RAD\ (MAX.)}$ and $t_{RCD\ (MAX.)}$ are specified as reference points only ; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC}, t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{RAD} \geq t_{RAD\ (MAX.)}$ and $t_{RCD} \geq t_{RCD\ (MAX.)}$ will not cause any operation problems.

3. $t_{CRP\ (MIN.)}$ requirement is applied to $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ cycles.

4. This specification is applied only to the μPD42S65405.

Read Cycle

Parameter	Symbol	t_{RAC} = 50 ns		t_{RAC} = 60 ns		Unit	Notes
		MIN.	MAX.	MIN.	MAX.		
Access time from $\overline{\text{RAS}}$	t_{RAC}	–	50	–	60	ns	1
Access time from $\overline{\text{CAS}}$	t_{CAC}	–	13	–	15	ns	1
Access time from column address	t_{AA}	–	25	–	30	ns	1
Access time from $\overline{\text{OE}}$	t_{OEA}	–	13	–	15	ns	
Column address lead time referenced to $\overline{\text{RAS}}$	t_{RAL}	25	–	30	–	ns	
Read command setup time	t_{RCS}	0	–	0	–	ns	
Read command hold time referenced to $\overline{\text{RAS}}$	t_{RRH}	0	–	0	–	ns	2
Read command hold time referenced to $\overline{\text{CAS}}$	t_{RCH}	0	–	0	–	ns	2
Output buffer turn-off delay time from $\overline{\text{OE}}$	t_{OEZ}	0	10	0	13	ns	3
$\overline{\text{CAS}}$ hold time to $\overline{\text{OE}}$	t_{CHO}	5	–	5	–	ns	4

Notes 1. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{\text{RAS}}$
$t_{RAD} \leq t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{RAC\ (MAX.)}$	$t_{RAC\ (MAX.)}$
$t_{RAD} > t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{AA\ (MAX.)}$	$t_{RAD} + t_{AA\ (MAX.)}$
$t_{RCD} > t_{RCD\ (MAX.)}$	$t_{CAC\ (MAX.)}$	$t_{RCD} + t_{CAC\ (MAX.)}$

$t_{RAD\ (MAX.)}$ and $t_{RCD\ (MAX.)}$ are specified as reference points only; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC}, t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{RAD} \geq t_{RAD\ (MAX.)}$ and $t_{RCD} \geq t_{RCD\ (MAX.)}$ will not cause any operation problems.

2. Either $t_{RCH\ (MIN.)}$ or $t_{RRH\ (MIN.)}$ should be met in read cycles.

3. $t_{OEZ(MAX.)}$ defines the time when the output achieves the condition of Hi-Z and is not referenced to V_{OH} or V_{OL}.

4. $\overline{\text{WE}}$: inactive (in read cycle)

$\overline{\text{CAS}}$: inactive, $\overline{\text{OE}}$: active $\cdots$ t_{CHO} is effective.

$\overline{\text{CAS}}$, $\overline{\text{OE}}$: active $\cdots$ t_{OCH} is effective.

Write Cycle

Parameter	Symbol	t_{RAC} = 50 ns		t_{RAC} = 60 ns		Unit	Notes
		MIN.	MAX.	MIN.	MAX.		
$\overline{WE}$ hold time referenced to $\overline{CAS}$	t_{WCH}	7	–	10	–	ns	1
$\overline{WE}$ pulse width	t_{WP}	7	–	10	–	ns	1
$\overline{WE}$ lead time referenced to $\overline{RAS}$	t_{RWL}	13	–	15	–	ns	
$\overline{WE}$ lead time referenced to $\overline{CAS}$	t_{CWL}	7	–	10	–	ns	
$\overline{WE}$ setup time	t_{WCS}	0	–	0	–	ns	2
$\overline{OE}$ hold time	t_{OEH}	0	–	0	–	ns	
Data-in setup time	t_{DS}	0	–	0	–	ns	3
Data-in hold time	t_{DH}	7	–	10	–	ns	3

Notes 1. $t_{WP\,(MIN.)}$ is applied to late write cycles or read modify write cycles. In early write cycles, $t_{WCH\,(MIN.)}$ should be met.

    2. If $t_{WCS} \geq t_{WCS\,(MIN.)}$, the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle.

    3. $t_{DS\,(MIN.)}$ and $t_{DH\,(MIN.)}$ are referenced to the $\overline{CAS}$ falling edge in early write cycles. In late write cycles and read modify write cycles, they are referenced to the $\overline{WE}$ falling edge.

Read Modify Write Cycle

Parameter	Symbol	t_{RAC} = 50 ns		t_{RAC} = 60 ns		Unit	Note
		MIN.	MAX.	MIN.	MAX.		
Read modify write cycle time	t_{RWC}	107	–	133	–	ns	
$\overline{RAS}$ to $\overline{WE}$ delay time	t_{RWD}	64	–	77	–	ns	1
$\overline{CAS}$ to $\overline{WE}$ delay time	t_{CWD}	27	–	32	–	ns	1
Column address to $\overline{WE}$ delay time	t_{AWD}	39	–	47	–	ns	1

Note 1. If $t_{WCS} \geq t_{WCS\,(MIN.)}$, the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If $t_{RWD} \geq t_{RWD\,(MIN.)}$, $t_{CWD} \geq t_{CWD\,(MIN.)}$, $t_{AWD} \geq t_{AWD\,(MIN.)}$ and $t_{CPWD} \geq t_{CPWD\,(MIN.)}$, the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.

Hyper Page Mode (EDO)

Parameter	Symbol	t_{RAC} = 50 ns		t_{RAC} = 60 ns		Unit	Notes
		MIN.	MAX.	MIN.	MAX.		
Read / Write cycle time	t_{HPC}	20	–	25	–	ns	1
$\overline{RAS}$ pulse width	t_{RASP}	50	125,000	60	125,000	ns	
$\overline{CAS}$ pulse width	t_{HCAS}	8	10,000	10	10,000	ns	
$\overline{CAS}$ precharge time	t_{CP}	7	–	10	–	ns	
Access time from $\overline{CAS}$ precharge	t_{ACP}	–	30	–	35	ns	
$\overline{CAS}$ precharge to $\overline{WE}$ delay time	t_{CPWD}	41	–	52	–	ns	2
$\overline{RAS}$ hold time from $\overline{CAS}$ precharge	t_{RHCP}	30	–	35	–	ns	
Read modify write cycle time	t_{HPRWC}	52	–	66	–	ns	
Data output hold time	t_{DHC}	5	–	5	–	ns	
$\overline{OE}$ to $\overline{CAS}$ hold time	t_{OCH}	5	–	5	–	ns	3
$\overline{OE}$ precharge time	t_{OEP}	5	–	5	–	ns	
Output buffer turn-off delay from $\overline{WE}$	t_{WEZ}	0	10	0	13	ns	4,5
$\overline{WE}$ pulse width	t_{WPZ}	7	–	10	–	ns	5
Output buffer turn-off delay from $\overline{RAS}$	t_{OFR}	0	10	0	13	ns	4,5
Output buffer turn-off delay from $\overline{CAS}$	t_{OFC}	0	10	0	13	ns	4,5

Notes 1. $t_{HPC (MIN.)}$ is applied to $\overline{CAS}$ access.

2. If $t_{WCS} \geq t_{WCS (MIN.)}$, the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If $t_{RWD} \geq t_{RWD (MIN.)}$, $t_{CWD} \geq t_{CWD (MIN.)}$, $t_{AWD} \geq t_{AWD (MIN.)}$ and $t_{CPWD} \geq t_{CPWD (MIN.)}$, the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.

3. $\overline{WE}$: inactive (in read cycle)

$\overline{CAS}$: inactive, $\overline{OE}$: active ······ t_{CHO} is effective.

$\overline{CAS}$, $\overline{OE}$: active ······ t_{OCH} is effective.

4. $t_{OFC (MAX.)}$, $t_{OFR (MAX.)}$ and $t_{WEZ (MAX.)}$ define the time when the output achieves the conditions of Hi-Z and is not referenced to V_{OH} or V_{OL}.

5. To make I/Os to Hi-Z in read cycle, it is necessary to control $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$ as follows. The effective specification depends on state of each signal.

(1) Both $\overline{RAS}$ and $\overline{CAS}$ are inactive (at the end of the read cycle)

$\overline{WE}$: inactive, $\overline{OE}$: active

t_{OFC} is effective when $\overline{RAS}$ is inactivated before $\overline{CAS}$ is inactivated.

t_{OFR} is effective when $\overline{CAS}$ is inactivated before $\overline{RAS}$ is inactivated.

The slower of t_{OFC} and t_{OFR} becomes effective.

(2) Both $\overline{RAS}$ and $\overline{CAS}$ are active or either $\overline{RAS}$ or $\overline{CAS}$ is active (in read cycle)

$\overline{WE}$, $\overline{OE}$: inactive ······ t_{OEZ} is effective.

Both $\overline{RAS}$ and $\overline{CAS}$ are inactive or $\overline{RAS}$ is active and $\overline{CAS}$ is inactive (at the end of read cycle)

$\overline{WE}$, $\overline{OE}$: active and either t_{RRH} or t_{RCH} must be met ······ t_{WEZ} and t_{WPZ} are effective.

The faster of t_{OEZ} and t_{WEZ} becomes effective.

The faster of (1) and (2) becomes effective.

Refresh Cycle

Parameter	Symbol	t_{RAC} = 50 ns		t_{RAC} = 60 ns		Unit	Note
		MIN.	MAX.	MIN.	MAX.		
$\overline{CAS}$ setup time	t_{CSR}	5	–	5	–	ns	
$\overline{CAS}$ hold time ($\overline{CAS}$ before $\overline{RAS}$ refresh)	t_{CHR}	10	–	10	–	ns	
$\overline{RAS}$ precharge $\overline{CAS}$ hold time	t_{RPC}	5	–	5	–	ns	
$\overline{RAS}$ pulse width ($\overline{CAS}$ befoe $\overline{RAS}$ self refresh)	t_{RASS}	100	–	100	–	μs	1
$\overline{RAS}$ precharge time ($\overline{CAS}$ before $\overline{RAS}$ self refresh)	t_{RPS}	90	–	110	–	ns	1
$\overline{CAS}$ hold time ($\overline{CAS}$ before $\overline{RAS}$ self refresh)	t_{CHS}	–50	–	–50	–	ns	1
$\overline{WE}$ setup time	t_{WSR}	10	–	10	–	ns	
$\overline{WE}$ hold time	t_{WHR}	15	–	15	–	ns	

Note 1. This specification is applied only to the μPD42S65405.

Read Cycle
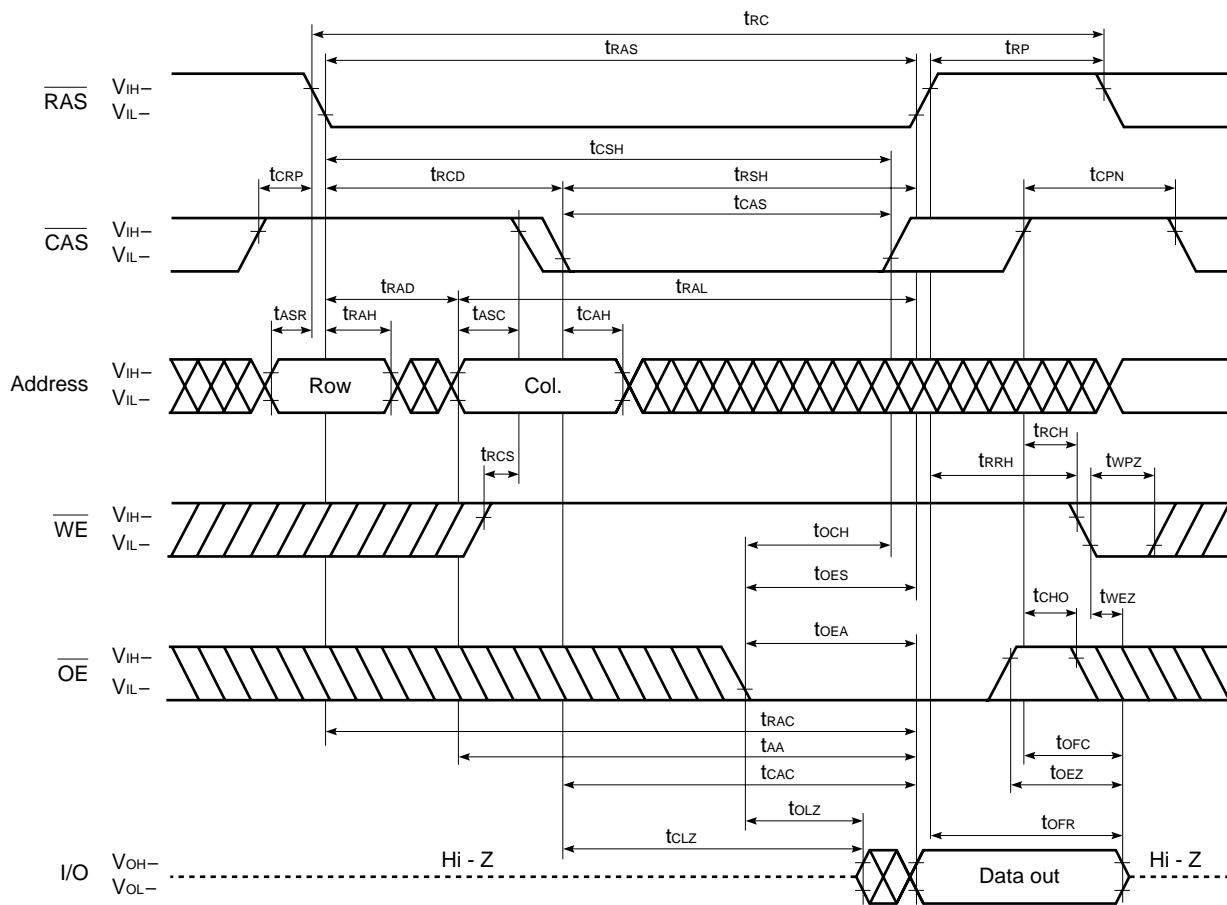

Early Write Cycle
Remark $\overline{OE}$: Don't care

Late Write Cycle
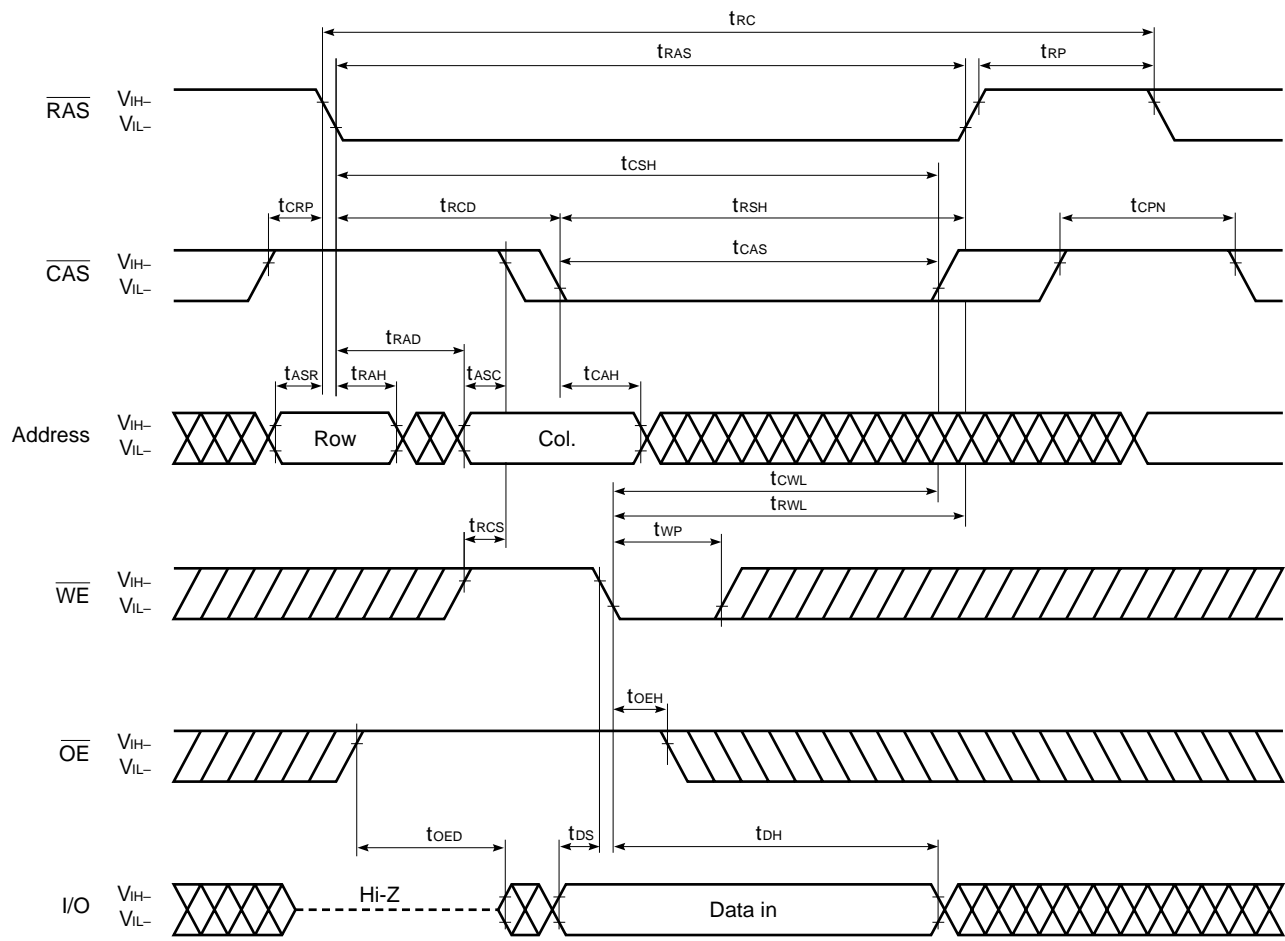

Read Modify Write Cycle

Hyper Page Mode (EDO) Read Cycle

**Remark** In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Read Cycle ($\overline{\text{WE}}$ Control)

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Read Cycle ($\overline{\text{OE}}$ Control)

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

Hyper Page Mode (EDO) Early Write Cycle
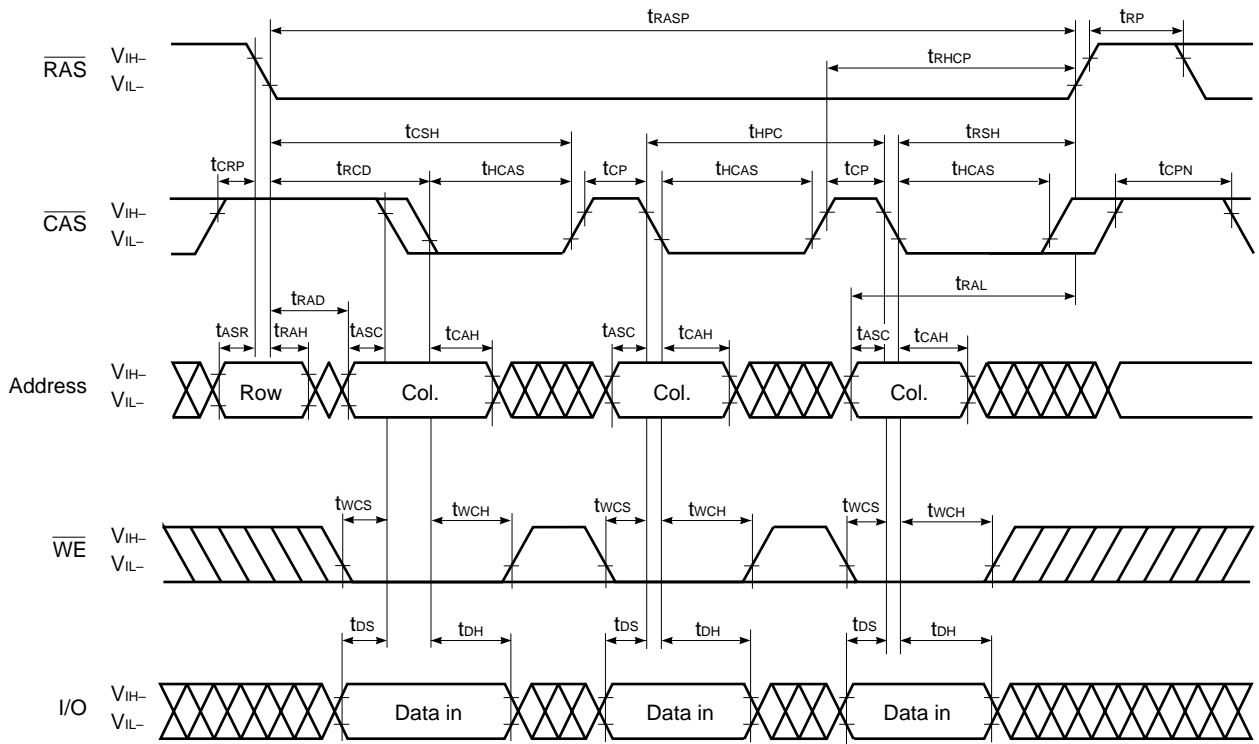

Remarks 1. $\overline{OE}$: Don't care

2. In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{CAS}$ cycles within the same $\overline{RAS}$ cycle.

Hyper Page Mode (EDO) Late Write Cycle
Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{CAS}$ cycles within the same $\overline{RAS}$ cycle.

Hyper Page Mode (EDO) Read Modify Write Cycle

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{CAS}$ cycles within the same $\overline{RAS}$ cycle.

Hyper Page Mode (EDO) Read and Write Cycle

Remark In the hyper page mode (EDO), read, write and read modify write cycles are available for each of the consecutive $\overline{\text{CAS}}$ cycles within the same $\overline{\text{RAS}}$ cycle.

★ $\overline{\text{CAS}}$ **Before** $\overline{\text{RAS}}$ **Self Refresh Cycle (Only for the** μ**PD42S65405)**
Remark Address, $\overline{\text{OE}}$: Don't care   I/O: Hi-Z

Cautions on Use of $\overline{\text{CAS}}$ **Before** $\overline{\text{RAS}}$ **Self Refresh**

$\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh can be used independently when used in combination with distributed $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ long refresh; However, when used in combination with burst $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ long refresh or with long $\overline{\text{RAS}}$ only refresh (both distributed and burst), the following cautions must be observed.

(1) **Normal Combined Use of** $\overline{\text{CAS}}$ **Before** $\overline{\text{RAS}}$ **Self Refresh and Burst** $\overline{\text{CAS}}$ **Before** $\overline{\text{RAS}}$ **Long Refresh**
When $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh and burst $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ long refresh are used in combination, please perform $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh 4,096 times within a 64 ms interval just before and after setting $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh.

(2) **Normal Combined Use of** $\overline{\text{CAS}}$ **Before** $\overline{\text{RAS}}$ **Self Refresh and Long** $\overline{\text{RAS}}$ **Only Refresh**
When $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh and $\overline{\text{RAS}}$ only refresh are used in combination, please perform $\overline{\text{RAS}}$ only refresh 4,096 times within a 64 ms interval just before and after setting $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh.

(3) If $t_{\text{RASS (MIN.)}}$ is not satisfied at the beginning of $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh cycles ($t_{\text{RAS}} < 100\ \mu$s), $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles will be executed one time.
If $10\ \mu$s $< t_{\text{RAS}} < 100\ \mu$s, $\overline{\text{RAS}}$ precharge time for $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self refresh (t_{RPS}) is applied.
And refresh cycles (4,096/128 ms) should be met.

For details, please refer to **How to use DRAM** User's Manual.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V$_{DD}$ or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.
