

**MSM512200/L****1,048,576-Word × 2-Bit DYNAMIC RAM : FAST PAGE MODE TYPE****DESCRIPTION**

The MSM512200/L is a 1,048,576-word × 2-bit dynamic RAM fabricated in Oki's silicon-gate CMOS technology. The MSM512200/L achieves high integration, high-speed operation, and low-power consumption because Oki manufactures the device in a quadruple-layer polysilicon/single-layer metal CMOS process. The MSM512200/L is available in a 26/20-pin plastic SOJ or 26/20-pin plastic TSOP. The MSM512200L (the low-power version) is specially designed for lower-power applications.

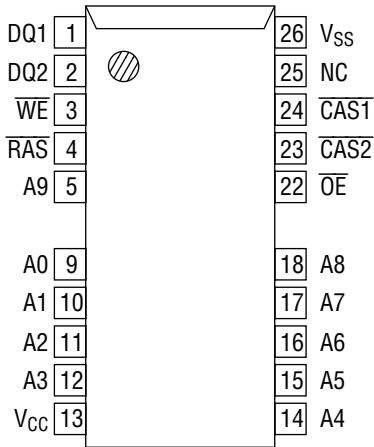

**FEATURES**

- 1,048,576-word × 2-bit configuration
  - Single 5 V power supply, ±10% tolerance
  - Input : TTL compatible, low input capacitance
  - Output : TTL compatible, 3-state
  - Refresh : 1024 cycles/16 ms, 1024 cycles/128 ms (L-version)
  - Fast page mode, read modify write capability
  - $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh, hidden refresh,  $\overline{\text{RAS}}$ -only refresh capability
  - Multi-bit test mode capability
  - Package options:
    - 26/20-pin 300 mil plastic SOJ (SOJ26/20-P-300-1.27) (Product : MSM512200/L-xxSJ)
    - 26/20-pin 300 mil plastic TSOP (TSOPII26/20-P-300-1.27-K) (Product : MSM512200/L-xxTS-K)
- xx indicates speed rank.

- Notes:
1. A start-up delay of 200  $\mu$ s is required after power-up, followed by a minimum of eight initialization cycles ( $\overline{\text{RAS}}$ -only refresh or  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh) before proper device operation is achieved.
  2. The AC characteristics assume  $t_T = 5$  ns.
  3.  $V_{IH}$  (Min.) and  $V_{IL}$  (Max.) are reference levels for measuring input timing signals. Transition times ( $t_T$ ) are measured between  $V_{IH}$  and  $V_{IL}$ .
  4. This parameter is measured with a load circuit equivalent to 2 TTL loads and 100 pF.
  5. Operation within the  $t_{RCD}$  (Max.) limit ensures that  $t_{RAC}$  (Max.) can be met.  $t_{RCD}$  (Max.) is specified as a reference point only. If  $t_{RCD}$  is greater than the specified  $t_{RCD}$  (Max.) limit, then the access time is controlled by  $t_{CAC}$ .
  6. Operation within the  $t_{RAD}$  (Max.) limit ensures that  $t_{RAC}$  (Max.) can be met.  $t_{RAD}$  (Max.) is specified as a reference point only. If  $t_{RAD}$  is greater than the specified  $t_{RAD}$  (Max.) limit, then the access time is controlled by  $t_{AA}$ .
  7.  $t_{OFF}$  (Max.) and  $t_{OEZ}$  (Max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
  8.  $t_{RCH}$  or  $t_{RRH}$  must be satisfied for a read cycle.
  9.  $t_{WCS}$ ,  $t_{CWD}$ ,  $t_{RWD}$ ,  $t_{AWD}$  and  $t_{CPWD}$  are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If  $t_{WCS} \geq t_{WCS}$  (Min.), then the cycle is an early write cycle and the data out will remain open circuit (high impedance) throughout the entire cycle. If  $t_{CWD} \geq t_{CWD}$  (Min.),  $t_{RWD} \geq t_{RWD}$  (Min.),  $t_{AWD} \geq t_{AWD}$  (Min.) and  $t_{CPWD} \geq t_{CPWD}$  (Min.), then the cycle is a read modify write cycle and data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, then the condition of the data out (at access time) is indeterminate.
  10. These parameters are referenced to the  $\overline{\text{CAS}}$  leading edge in an early write cycle, and to the  $\overline{\text{WE}}$  leading edge in an  $\overline{\text{OE}}$  control write cycle, or a read modify write cycle.
  11. The test mode is initiated by performing a  $\overline{\text{WE}}$  and  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh cycle. This mode is latched and remains in effect until the exit cycle is generated. The test mode specified in this data sheet is a 2-bit parallel test function. CA0 is not used. In a read cycle, if all internal bits are equal, the DQ pin will indicate a high level. If any internal bits are not equal, the DQ pin will indicate a low level. The test mode is cleared and the memory device returned to its normal operating state by performing a  $\overline{\text{RAS}}$ -only refresh cycle or a  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh cycle.
  12. In a test mode read cycle, the value of access time parameters is delayed for 5 ns for the specified value. These parameters should be specified in test mode cycle by adding the above value to the specified value in this data sheet.
  13. These parameters are determined by the falling edge of either  $\overline{\text{CAS1}}$  or  $\overline{\text{CAS2}}$ , whichever is earlier.
  14. These parameters are determined by the rising edge of either  $\overline{\text{CAS1}}$  or  $\overline{\text{CAS2}}$ , whichever is later.
  15.  $t_{CWL}$ ,  $t_{DH}$  and  $t_{DS}$  should be satisfied by both  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$ .
  16.  $t_{CP}$  is determined by the time both  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$  are high.

**Notes concerning  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$  control**

Overlap the active-low timings of  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$ . Skew between  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$  is allowed under the following conditions:

- (1) The timing specification for  $\overline{\text{CAS1}}$  and  $\overline{\text{CAS2}}$  should be met individually.
- (2) Different operation modes for  $\overline{\text{CAS1}}/\overline{\text{CAS2}}$  are not allowed (as shown below).

- (3) Closely separated  $\overline{\text{CAS1}}/\overline{\text{CAS2}}$  control is not allowed. However, when the condition ( $t_{CP} \leq t_{UL}$ ) is satisfied, fast page mode can be performed.
