For the alternate pin-out (see page 4) , add suffix "P2" to model number (i.e. MA224S-05RW-P2)

Notes:

1. Cross regulation is measured with the output being tested at 100% load while the other output is varied from 25% to 100% load.
2. See the typical connection circuit on page three for typical external filtering components. For help with a specific model or layout issue, contact the factory.
3. Isolation voltage is specified for Input to output. On units with the optional metal case, the isolation voltage for Input - Case and Output - Case is 1,000 VDC.
4. Operation at no-load will not damage the unit, but they may not meet all specifications. To meet all specifications, a minimum load of 25% should be maintained.
5. It is recommended that a fuse be used on the input of a power supply for protection. See the Model Selection table above for the correct rating.

Typical Connection

The diagram above illustrates a typical connection of the **MA200RW** series for applications that require meeting conducted EMC standards. The units do not require external components to operate as specified. For applications requiring very low output noise levels, the output filtering capacitors (C<sub>3</sub> is a low ESR electrolytic & C<sub>4</sub> is a ceramic) will often be sufficient. Care must be taken in choosing output capacitors not to exceed the capacitive load specification for the unit. For dual output units, output capacitors should be connected from each output to common. All external components should be mounted as close to the unit as possible.

The recommended values for components are:

Component	5 V <sub>IN</sub>	12 V <sub>IN</sub>	24 V <sub>IN</sub>	48 V <sub>IN</sub>
C <sub>1</sub>	220 μF/25V	220 μF/50V	220 μF/100V	220 μF/100V
LCM	12 μH	12 μH	12 μH	12 μH
C <sub>2</sub>	---	---	470 pF/2kV MLCC	470 pF/2kV MLCC
C <sub>3</sub>	100 μF	100 μF	100 μF	100 μF
C <sub>4</sub>	4.7 - 10 μF	4.7 - 10 μF	4.7 - 10 μF	4.7 - 10 μF

Typical Board Layout: With External Filter Components, Dual Output
