

600mA LOW DROPOUT LINEAR REGULATOR

FEATURES

- Application for Extreme Low 1.0 & 1.2V Output Voltage
- Guaranteed 600mA Output Current
- Very Low Quiescent Current at about 30uA
- $\pm 2\%$ Output Voltage Accuracy for 1V~3.3V
- Needs Only 1 μ F Capacitor for Stability
- Thermal Shutdown Protection
- Current Limit Protection
- Low-ESR Ceramic Capacitor for Output Stability.
- Tiny SOT-23-5L & SC-70-5L, SOT-223, SOT-89(R) & TO-252 Package type
- RoHS Compliant & Halogen Free
- High PSRR

DESCRIPTION

The APE8862 series are low dropout, positive linear regulators with very low quiescent current. The APE8862 can supply 600mA output current with a low dropout voltage & very low output voltage.

The APE8862 regulator is able to operate with output capacitors as small as 1 μ F for stability. Other than the current limit protection APE8862 also offers on chip thermal shutdown feature providing protection against overload or any condition when the ambient temperature exceeds the junction temperature.

The APE8862 series are offering several fixed output voltage types including 1.0V ~ 1.5V.

The APE8862 series are available in low-profile, space-saving SOT-23-5L, SC-70-5L, SOT-223, SOT-89(R) & TO-252 packages.

APPLICATIONS

- DVD/CD-ROMs, CD/RWs
- Wireless Devices
- LCD Modules
- Battery Power Systems
- Card Readers
- XDSL Routers

Note 1 : The dropout voltage is defined as $V_{IN}-V_{OUT}$, which is measured when V_{OUT} drop about 100mV.

Note 2 : Regulation is measured at a constant junction temperature by using 30ms current pulse and load regulation in the load range from 0mA to 600mA.

PIN DESCRIPTIONS

PIN SYMBOL	PIN DESCRIPTION
VIN	Power is supplied to this device from this pin which is required an input filter capacitor. In general, the input capacitor in the range of $1\mu\text{F}$ to $10\mu\text{F}$ is sufficient.
VOUT	The output supplies power to loads. The output capacitor is required to prevent output voltage unstable. The APE8862 is stable with an output capacitor $1\mu\text{F}$ or greater. The larger output capacitor will be required for application with large transit load to limit peak voltage transits, besides could reduce output noise, improve stability, PSRR.
GND	Common ground pin
BP	Reference Noise Bypass (the Bypass Capacitor $\geq 1\text{nF}$)
SHDN	Chip Enable (Active High)

Application Information

The APE8862 series are low dropout linear regulators that could provide 600mA output current at dropout voltage about 300mV. Besides, current limit and on chip thermal shutdown features provide protection against any combination of overload or ambient temperature that could exceed junction temperature.

1. Output and Input Capacitor

The APE8862 regulator is designed to be stable with a wide range of output capacitors. The ESR of the output capacitor affects stability. Larger value of the output capacitor decreases the peak deviations and provides to improve transition response for larger current changes.

The capacitor types (aluminum, ceramic, and tantalum) have different characterizations such as temperature and voltage coefficients. All ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior across temperature and applications. Common dielectrics used are X5R, X7R and Y5V. It is recommended to use 1uF X5R or X7R dielectric ceramic capacitors with 30mΩ to 50mΩ ESR range between device outputs to ground for transient stability. The APE8862 is designed to be stable with low ESR ceramic capacitors and higher values of capacitors and ESR could improve output stability.

So the ESR of output capacitor is very important because it generates a zero to provide phase lead for loop stability.

There are no requirements for the ESR on the input capacitor, but its voltage and temperature coefficient have to be considered for device application environment.

2. Protection Features

In order to prevent overloading or thermal condition from damaging the device, APE8862 regulator has internal thermal and current limiting functions designed to protect the device. It will rapidly shut off PMOS pass element during overloading or over temperature condition.

3. Thermal Consideration

The power handling capability of the device will be limited by maximum operation junction temperature (125°C). The power dissipated by the device will be estimated by $PD = I_{OUT} \times (VIN - VOUT)$. The power dissipation should be lower than the maximum power dissipation listed in "Absolute Maximum Ratings" section.
